Glossary

Ancillary Own Funds

Ancillary Own Funds shall consist of items other than Basic Own Funds which can be called up to absorb losses. They require supervisory approval and cannot be used to cover the MCR. (Solvency II Directive 2009/138/EC, Article 89)

Basic Own Funds

Basic Own Funds are composed of the excess of assets over liabilities, valued according to market-consistent principles, and subordinated liabilities.

Best Estimate

The Best Estimate is part of the Technical Provisions. It corresponds to the probability-weighted average of future cash-flows, taking account of the time value of money (expected present value of future cash-flows), using the relevant Risk-free Interest Rate Term Structure. The calculation of the Best Estimate is based upon up-to-date and credible information and realistic assumptions and is performed using adequate, applicable and relevant actuarial and statistical methods. The cash-flow projection used in the calculation of the Best Estimate takes account of all the cash in- and out-flows required to settle the insurance and reinsurance obligations over the lifetime thereof. It is calculated gross of reinsurance.

Minimum Capital Requirement

The Minimum Capital Requirement corresponds to an amount of eligible Basic Own Funds. Below this amount policy holders and beneficiaries are exposed to an unacceptable level of risk so that insurance and reinsurance undertakings are not allowed to continue their operations. (Solvency II Directive 2009/138/EC, Article 129)"

Own Risk and Solvency Assessment (ORSA)

Own Risk and Solvency Assessment is a risk management process which connects business strategy and capital planning and which is an integral part of the business strategy. ORSA needs to be performed annually or whenever the risk profile changes significantly. The process is owned by the Board, and has to be documented and reported internally and to the supervisor.

Own Funds

Own Funds are defined as the sum of Basic Own Funds and Ancillary Own Funds. (Solvency II Directive 2009/138/EC, Article 77)

Reconciliation Reserve

The Reconciliation Reserve (revaluation reserve) is part of the own funds of the Solvency II balance sheet. It results from the surplus of assets over liabilities less items such as share capital, capital reserve or foundation fund, preference shares and surplus fund. In addition, adjustments must be made, like for foreseeable dividend payments.

Risk Margin

The Risk Margin is part of the Technical Provisions and shall be such as to ensure that the value of the Technical Provisions is equivalent to the amount that insurance and reinsurance undertakings would be expected to require in order to take over and meet the insurance and reinsurance obligations. The Risk Margin is determined by the cost of providing an amount of eligible own funds equal to the Solvency Capital Requirement necessary to support the insurance and reinsurance obligations over the lifetime thereof. (Solvency II Directive 2009/138/EC, Article 77)

Risk-free Interest Rate

The Risk-free Interest Rate term structure is relevant for the calculation of liabilities by insurance and reinsurance undertakings. EIOPA is required to publish the Risk-free Interest Rate for Solvency II.

As a default approach, the Risk-free Interest Rate is primarily derived from the rates at which two parties are prepared to swap fixed and floating interest rate obligations. (EIOPA-BoS-15/035)

Solvency Capital Requirement (SCR)

The Solvency Capital Requirement should reflect a level of eligible own funds that enables insurance and reinsurance undertakings to absorb significant losses and that gives reasonable assurance to policy holders and beneficiaries that payments will be made as they fall due. This amount is determined with reference to the risks assumed by the company. (Solvency II Directive 2009/138/EC, Paragraph 62)

Solvency II Ratio

The Solvency II Ratio represents the company's own funds against its SCR. Insurance and reinsurance undertakings are required to maintain their Solvency II Ratio above 100 %. If the ratios are lower, measures are initiated by the national supervisory authority, such as the need for an action plan to restore the ratios to required levels.

Surplus Funds

Surplus Funds shall be deemed to be accumulated profits which have not been made available for distribution to policy holders and beneficiaries.

In so far as authorised under national law, Surplus Funds shall not be considered as insurance and reinsurance liabilities to the extent that they fulfil the criteria set out in Article 94(1). (Solvency II Directive 2009/138/EC, Article 91)

Technical Provisions

The value of the Technical Provisions under Solvency II correspond to the amount which another insurance or reinsurance undertaking would be expected to require to take over and fulfil the underlying insurance and reinsurance obligations. They are calculated as the sum of the best estimates liabilities and the Risk Margin.

Volatility Adjustment

The Volatility Adjustment is a measure to ensure the appropriate treatment of insurance products with long-term guarantees under Solvency II. (Re) insurers are allowed to adjust the risk-free-rate to mitigate the effect of short-term volatility of bond spreads on their solvency position. In that way, the Volatility Adjustment prevents pro-cyclical investment behavior of (re)insurers.

Forward-looking statements are subject to many factors, and no assurance, warranty or guarantee is given that the forward-looking statements will take place or be fulfilled as expected. Furthermore, new factors with a significant impact on forward-looking statements may arise at any time. It cannot be predicted what these factors are and what influence they have individually or in combination with other circumstances. It is not intended to update any of these forward-looking statements and information due to changed circumstances or new knowledge unless expressly required by applicable laws or regulations.

SFCR - Executive Summary

Introduction

Baloise Belgium NV is a composite insurance company. It operates under the legal form of a Limited Liability Company ('Naamloze Vennootschap'). Baloise Belgium NV is part of, and strongly embedded in the Baloise Group (owned by Baloise Holding Ltd, Switzerland). Located at the heart of Europe, with its head office in Basel, the Baloise Group is a provider of prevention, pension assistance and insurance solutions.

Under the current prudential insurance regulation framework (commonly known as the 'Solvency II' regime), a broad range of requirements has been implemented for insurance companies, in view of assuring their long term financial solidity. For this purpose, insurers must among others provide capital buffers which are adequate in function of the risks they take (the solvency requirements), they must apply appropriate organisational structures and rules (the governance requirements), and they have to provide all necessary information allowing the competent authorities to control their activities (the supervisory reporting requirements). Finally, insurers also have to inform the public on their financial position (the public disclosure requirements).

The purpose of this report is to comply with the public disclosure requirements under the applicable Belgian and European legislation and regulation¹. The elements of this disclosure relate to the company's business and performance, system of governance, risk profile, solvency valuation and capital management.

Baloise Belgium NV acts in a transformative time, an era of change characterized by new risks and opportunities (changing mobility, increasing electrification, cyber risks, green energy, artificial intelligence,...) on the one hand, and by fundamental changes in ecological and social condition (nature disasters, politically unstable regions, international migration, impact of social media, stricter regulations ...) and in individual customer behavior on the other hand. Traditional insurance business models are being challenged by new ways of work, further digitalisation, an increasing market consolidation and legislation aimed at consumer protection and transparency.

¹ the 'Law of March 13th 2016 on the Regulation and Supervision of Insurance and Reinsurance Undertakings' and corresponding regulations, implementing the Solvency II Directive 2009/138/EC, the Commission Delegated Regulation (EU) 2015/35, its amendments, the implementing regulation 2023/895, and the EIOPA Guidelines on Reporting and Disclosure.

Baloise Belgium NV's strategy is developed in close connection with the overall Baloise Group 'Refocusing Strategy' approach. It emphasizes on strengthening our core business, growing in specific chosen market segments, focus on simple and efficient services, processes and tools and as such delivering an exceptional experience towards our partner-brokers.

The strategy is oriented towards realizing a stable growth of the sustainable earnings, both in the life and the non-life business, with a strong focus on profitability and solvency. This will also assure the efficient investment of the capital provided by the shareholder.

Highlights

Macroeconomic environment and financial markets.

The macroeconomic situation in 2024 was characterized by a number of global challenges. The ongoing war in Ukraine, as well as the further expansion of the conflict in the Middle East, led to a tense geopolitical situation. Shifts in the political landscape increased the volatility in the financial markets. Baloise's insurance business is not directly affected by the wars, but the indirect effects on the market environment are further closely monitored. It is clear that our customers, employees and investors can rely on us under these circumstances. Baloise's solid economic substance also endures in this environment.

The lower inflation in 2024 allowed the main central banks to reduce their policy rates, which was also reflected in a steady and significant decrease of the short term market rates. Longer term rates and credit spreads moved more sideways, albeit with some fluctuations during the year. This results in a more normal yield curve. The major equities markets performed strongly in 2024.

Under these challenging circumstances, Baloise remains well positioned thanks to a solid capital base and a long-term investment strategy.

Significant business decisions in 2024.

On February 1st 2024, Baloise Belgium NV announced it had entered into a reinsurance transaction with RGA International in view of the optimisation of its 'classic' individual life portfolio in run-off. In this reinsurance transaction, all of the portfolio's biometric and financial risks are transferred, while Baloise Belgium NV, in its capacity of insurer, remains the point of contact for customers and partners.

Also in 2024, the company decided a far-reaching exit from its marine business under the refocusing strategy.

Business and Performance

Continuation of solid business results in a competitive market.

In terms of business volume, the company's total gross earned premiums in 2024 reached € 2,141.2 million, from € 2,041.5 million (+4.9 %) the year before.

In the life activity, the company realized a premium growth of 18.2 %. This growth was supported by a significant increase of the volume of single premiums where both the branches 23 and 26 grew². Nevertheless, branch 21 remains the largest life branch, representing 67.5 % of the total life premium volume.

In the non-life activity, the premium volume remained practically constant (+0.1 %). However, if abstraction were made of the far-reaching exit from the marine business under the refocusing strategy in 2024, the gross earned premium would have been higher. The highest growth figures are realized for the 'Fire and other damage to property' and 'Other motor' lines of business.

In terms of underwriting profitability of the non-life activity as a whole, we notice an increase of the total gross and net result, mainly thanks to lower expenses and a lower reinsurance cost.

In the life activity, the underwriting result³ remained stable compared to 2023. For contracts covered by the 2024 classic individual life reinsurance transaction, the charge of the interest rate guarantee is henceforth borne by the reinsurer. For the remaining life portfolio⁴, the average guaranteed technical interest rate amounts to 1.54 %, whereas before this transaction, the average guaranteed rate for the whole life portfolio amounted to 1.77 %.

Further, the net BGAAP investment income (excluding branch 23) decreased in comparison with 2023 as a result of the lower volume of income generating assets after the aforementioned classic life reinsurance transaction early in 2024. Realisations and value corrections (impairments and reversals) had no material impact on the investment income in 2024.

As disclosed in Baloise Belgium NV's annual report, the company was able to close the year 2024 with a total net profit of € 63.7 million (€ 53.3 million in 2023) in accordance to BGAAP. This despite the

² branches 21 and 26 provide a technical interest rate guarantee, branch 23 is unit linked business.

³ Corrected for claims and changes in technical provisions, covered by variations in unit linked assets.

⁴ i.e. the life portfolio not covered by the 2024 classic life reinsurance transaction.

competitive insurance market and the widespread global uncertainty. Both the life and the non-life activity provided positive contributions to the technical result.

System of Governance

We practice sound and responsible corporate governance.

Baloise Belgium NV attaches great importance to practicing and keeping up to date a sound, responsible corporate governance in an environment with continuously evolving challenges and risks.

The company's system of governance guarantees the clear definition of roles and responsibilities with respect to the company's organisation. The independent control functions⁵ provide additional assurance for its correct implementation.

In its latest annual report on the adequacy of the system of governance, the Executive Committee confirmed that it assesses this system of governance as adequate to the nature, scale and complexity of the risks inherent to the company's business. Governance principles and framework are in line with regulatory requirements. Furthermore, the fit and proper process, together with the company's Code of Conduct ensures the adequacy of key staff.

Risk Profile

All material risks are identified, assessed and managed.

The company's risk management system comprises a comprehensive range of processes to identify, measure, assess, mitigate and monitor its risk position and to assure adequate reporting thereon. The regular assessments of the risks as defined in the Baloise Risk Map are performed by the functional responsible persons in the organisation, who act as risk owners and controllers, and so guarantee the integration of risk management throughout the company's organisation. The risk management function coordinates, challenges and further integrates the results of these 'bottom-up' risk assessments as an independent control function in the second line.

Additionally the company has implemented specific processes to assess its strategic risks (i.e. which might threaten the realisation of the company's business plan, and which are assessed from a 'top-down' perspective) as well as its emerging risks. And in addition to the aforementioned more qualitatively oriented approach, the (aggregated) risk categories defined under the official Solvency II regulatory framework are also assessed and managed within the quantitative framework of the Solvency II standard formula in view of the company's capital management. The integration of all these elements then allows

⁵ The actuarial function, the risk management function, the compliance function and the internal audit function.

the company to establish its risk profile, of which compliance with the regulatory and internal risk appetite based requirements is monitored.

Market risk and non-life underwriting risk are the key elements of the company's risk profile.

The most recent assessments of the company's risk profile did in general not reveal any drastic changes, compared to the previous year and confirmed the adequate management of its risks.

Given the large volumes of investments the company makes, in particular with respect to its life activity, market risks take a prominent position in the risk profile. The main market risks comprise first and foremost the credit spread risk, and further property risk. The equity risk increased over 2024, given the additional equity investments the company made in this year. The company's strategy to keep the durations of assets and liabilities aligned, limits the exposure to interest risk (i.e. the risk of fluctuations of the interest rates which impact the valuation of fixed income assets, and also of liabilities). The temporary and limited increase of the interest risk, present at YE2023, was reversed after the settlement of the initial premium for the 2024 classic life reinsurance transaction. Baloise Belgium NV's active management of these market risks includes among others the application of strict quality criteria when selecting assets, the follow up and management of the duration gap between assets and liabilities, and the close monitoring of the asset positions in terms of concentration risk. The company also emphasizes the high importance it attaches to the sustainability of its investments, by taking into account ESG (Environmental, Social, Governance) related criteria when selecting its investments.

Considering the importance of the company's non-life underwriting activities, appropriate management of the catastrophe, premium and reserving risks is also assured. This is realized by the application of strict underwriting criteria and procedures, regular follow up of profitability of the business and the adequacy of the technical provisions, and by a comprehensive reinsurance program.

Counterparty default risk is carefully managed by strict requirements imposed on counterparties. Whereas the 2024 classic life reinsurance transaction has given rise to significant amounts of reinsurance recoverables, the corresponding counterparty default risk is mitigated by collateralisation, involving adequate levels of custodied assets.

The latest risk assessments also confirmed the company's focus on, and appropriate monitoring and mitigation of the operational risks. Information Technology (IT) related risks, and risks related to outsourcing and major projects received, among others, great attention in 2024. The internal control system provides a systematic coverage of the operational risks, based on a detailed and recurring company-wide risk analysis at the level of the elementary business processes, the definition of appropriate measures and controls and a recurrent assessment of the effectiveness and the observation of these control measures.

In order to monitor its risk profile, Baloise Belgium NV also regularly calculates how sensitive its solvency position is to changes in its relevant risk factors. The results of sensitivity analyses that show the impact of standard changes in interest rates, credit spreads and equity quotations on the solvency ratio can be found in the 'Risk Profile' chapter of this report.

Valuation for Solvency Purposes

Material differences between Solvency II and local accounting rules have been analyzed and explained.

The valuation principles Baloise Belgium NV uses for solvency purposes, namely for determining the capital, available to absorb adverse realisations of its risk exposure⁶, are in line with the Solvency II legislation and regulation, and essentially reflect valuation at fair value. This means that for the most important assets and liabilities, valuation is either based on market prices (if available) or on model based calculations.

As a result, significant differences in valuation can occur with those obtained under the traditional Belgian Generally Accepted Accounting Principles ('BGAAP') rules, as used in the company's financial statements.

The difference is significant for the company's bonds portfolio which is the asset class with the biggest share in the asset allocation. There, the evolution of the interest rates over the past years has resulted in valuations for solvency purposes which now lie 10.1 % below those under BGAAP (end of 2023 the difference amounted to 9.2 %).

Solvency valuation of insurance liabilities (resulting in the technical provisions) is based on best estimates of discounted, model based future cash flows, to which a risk margin is added. Under BGAAP, traditional and prudent methods are used with ample reference to tariff base elements.

Therefore solvency valuation of technical provisions is sensitive to changes in interest rate levels, but also to other model assumptions like mortality rates (in life insurance) and claims ratios (in non-life insurance). The solvency valuation of technical provisions results in total in lower values (-11.6 %) than under BGAAP. In 2023 the difference amounted to 10.7 %.

Baloise Belgium NV has applied the volatility adjustment for the valuation of its liabilities under the Solvency II framework. This specific 'long term guarantee' measure allows the company to consider liabilities values which are compensated for certain fluctuations of the actual asset valuations, related to, for instance, changing credit spreads. The company does not use any transitional measures for the valuation of its liabilities.

⁶ Or technically spoken, the own funds available to cover the regulatory 'Solvency Capital Requirement'.

Application of the valuation principles for solvency purposes at 31/12/2024 results in a total asset value of € 12,511.7 million (€ 13,306.3 million under BGAAP) and a total liabilities value of € 11,230.5 million (€ 12,466.1 million under BGAAP). This resulted in an excess of assets over liabilities (under valuation for solvency purposes) of € 1,281.2 million, and, after also taking into account the company's subordinated liabilities, a capital available (and eligible) to cover the solvency capital requirement of € 1,660.1 million.

In 2024, there were no major changes in the company's valuation principles for solvency purposes.

Capital Management

The company continuously complies with solvency and capital management requirements.

Assuring a capital position which complies with the regulatory requirements and which provides adequate protection in view of Baloise Belgium NV's evolving insurance activities, lies at the heart of the company's capital management.

The Baloise Belgium NV Solvency II ratio increased from 174.5 % at YE2023 to 177.7 % at YE2024, which is well above the regulatory requirement of an SCR ratio above 100 %. Moreover, 73.8 % of the eligible own funds is ranked as unrestricted tier 1, which means that it has the highest possible quality of own funds

The underlying creation of eligible own funds⁷ reflects first and foremost the profitability of the company's operations, but also its solid investments. There were further also contributions from the immediate effect of the 2024 classic life reinsurance transaction and from a number of model and parameter updates. The decrease of the market interest rates had only a very limited impact on the net own funds position.

Based on the large volume of the company's investments, the market risk forms the largest part of the SCR, with spread risk as its largest sub-risk, followed by property risk. Overall the capital requirement for market risk increased slightly over 2024, mainly due to some additional equity investments whereas the new 2024 classic life reinsurance transaction mitigated this increase.

The capital requirement for the non-life underwriting risk decreased slightly. Here, the company's far-reaching exit from the marine business under the refocusing strategy contributed to the decrease as well as the lower technical provisions for certain lines of business.

The largest decrease in SCR occurs in the counterparty default risk, thanks to the reduction of the company's exposure to banks after the cash settlement of the initial premium for the 2024 classic life reinsurance transaction.

⁷ Of € 9.0 million after dividend charge

This led to an over-all decrease of the Solvency Capital Requirement of € 11.9 million.

The table below summarizes the company's position in terms of own funds, required capital, and the resulting solvency ratios, both at YE2023 and YE2024.

Solvency Position

	2023	2024
In '000 EUR		
Total eligible own funds to meet the MCR	1,265,138.8	1,308,532.1
Minimum Capital Requirement	425,809.9	420,474.2
Ratio of Eligible Own Funds to Minimum Capital Requirement	297.1%	311.2%
Total eligible own funds to meet the SCR	1,651,148.0	1,660,097.9
Solvency Capital Requirement	946,244.3	934,387.1
Ratio of Eligible Own Funds to Solvency Capital Requirement	174.5%	177.7%

A. Business and performance

A.1. Business

A.1.1. General information

Baloise Belgium NV is a Belgian composite insurance company, operating under the legal form of a Limited Liability Company ('Naamloze vennootschap').

The 'Nationale Bank van België' ('NBB') is its supervisory authority. The NBB has its registered office at the de Berlaimontlaan 14 in 1000 BRUSSELS. The external auditor is Ernst & Young Bedrijfsrevisoren BV (represented by J. Klaykens), Kouterveldstraat 7B, 1831 Diegem.

Baloise Belgium NV owns 99.82 % of the capital of Euromex, a Belgian Limited Liability Company which is active in legal assistance insurance.

Baloise Holding AG (with registered office at Aeschengraben 21, 4001 Basel, SWITZERLAND <https://www.baloise.com/de/home/information/impressum.html>) is the single shareholder of Baloise Belgium NV, holding 100 % of the capital. By this way, Baloise Belgium NV is part of, and strongly embedded in the Baloise Group (which is also owned by Baloise Holding AG⁸), a Swiss based financial services provider, which offers insurance and pension solutions.

At the end of 2024, in addition to its Swiss and Belgian activities, the Group had significant foreign operations in Germany, Luxembourg and Liechtenstein.

The following graph shows further details of Baloise Belgium NV's position within the legal structure of the Baloise Group.

⁸ Baloise Group acts under the supervision of the Swiss 'Financial Market Supervisory Authority ('FINMA')', which can be contacted at Laupenstrasse 27 - CH-3003 Bern.

An active interaction exists between the Group and its Belgian subsidiary, based among others on the presence of Group representatives in Baloise Belgium NV's Board of Directors, and on the comprehensive management reporting procedures. Important synergies exist among others in ICT, in asset management and in risk management.

A.1.2. Significant business and geographical coverage

A.1.2.1. Main business lines and geographical areas

In 2024, Baloise Belgium NV realized a total BGAAP⁹ gross earned premium volume of € 2,141.2 million, (from € 2,041.5 million in 2023) with the majority of this volume (70.1 %) realised in the non-life activity. The table below compares the volumes realized in 2024 to those realized in 2023.

Gross earned premium by activity group

	2023		2024		Change compared to previous year
	Premium volume	% of total	Premium volume	% of total	
In '000 EUR					
Activity group					
Non-life	1,499,523.2	73.5%	1,500,624.1	70.1%	0.1%
Life	541,969.9	26.5%	640,566.5	29.9%	18.2%
Total	2,041,493.1	100.0%	2,141,190.6	100.0%	4.9%

⁹ BGAAP data as mentioned in this chapter are based on the statutory accounts as used for the company's official financial reporting, but make abstraction of the company's group insurance for own staff members.

At 31/12/2024, the corresponding total technical provisions, according to Solvency II (including best estimates and risk margin) amounted to € 10,295.8 million (from € 10,329.3 million at 31/12/2023), which means that these decreased by 0.3 % over 2024. This net decrease results from the combination of a decrease in non-life (by € 89.9 million) and an increase in life (by € 56.4 million). We refer to the chapter D Valuation for more details on this evolution.

The non-life portfolio:

In 2024, the total earned premium volume in non-life increased by 0.1 %. When considering this growth rate, the far-reaching exit from the marine business under the refocusing strategy has to be taken into account (see further). If abstraction were made of this activity, the growth of the gross earned premium would have been higher.

Direct business represents 96.8 % of the total gross earned premium volume.

Below, we present a split of the total non-life premium volume by line of business.

Gross earned premium 'non-life' by line of business

	2023	2023	2024	2024	
	Premium volume	% of total (non-life)	Premium volume	% of total (non-life)	Change compared to previous year
In '000 EUR					
Line of business					
Income protection insurance	36,592.3	2.4%	36,123.0	2.4%	-1.3%
Workers' compensation insurance	106,935.5	7.1%	107,402.7	7.2%	0.4%
Motor vehicle liability insurance	332,733.1	22.2%	328,077.1	21.9%	-1.4%
Other motor insurance	248,882.3	16.6%	263,338.0	17.5%	5.8%
Marine, aviation and transport insurance	148,959.7	9.9%	94,205.0	6.3%	-36.8%
Fire and other damage to property insurance	499,089.6	33.3%	541,457.8	36.1%	8.5%
General liability insurance	99,556.9	6.6%	101,142.4	6.7%	1.6%
Other	26,773.8	1.8%	28,878.1	1.9%	7.9%
Total (Non Life)	1,499,523.2	100.0%	1,500,624.1	100.0%	0.1%

The largest premium increase in absolute and relative terms is realized for the 'fire and other damage to property' line of business' which remains the biggest business line expressed in premium volume. There is also a significant growth in 'Other motor insurance'.

The strong decrease for MAT is already explained above. The decrease we observe for the 'workers' compensation insurance' is a consequence of the fact that the premium volume for 2023 contained exceptional correction premiums in order to recover Covid related underestimations of premiums due in 2022.

Apart from these two lines of business, the 'motor vehicle liability' activity is the only one where the premium volume decreased. Amidst fierce competition, Baloise Belgium NV has chosen to focus more on rentability.

The business volume written outside the home market represented 10.0 % of the total in 2024. By far the largest part of this foreign business (9.4 % of the total volume) is written in the Netherlands, thanks to both Baloise Belgium NV's Dutch branch and the cooperation with a number of underwriting agencies. The main lines of business are here Marine & transport, Fire and other damage to property, and Motor vehicle liability. Further, besides the French market (where the company realizes 0.3 % of its written premium), foreign non-life activities only represent negligible volumes.

The life portfolio:

Year over year, Baloise Belgium NV's earned premium volume in life (including health similar to life) increased in total by 18.2 % in 2024. While the total volume of recurring premiums remained practically constant, there was a significant increase in the volume of new single premiums (a.o. thanks to the large amounts of cash that came available in the Belgian savings market from a maturing Belgian Government bond).

Volumes of recurring premiums slightly decreased in branch 21 and slightly increased in branch 23¹⁰. The share of branch 21 in the life recurring premiums new business amounted to 74.3 % and that of branch 23 to 17.4 %¹¹.

Within the new single premiums volume, both branches 23 and 26 grew in comparison to 2023, while there was a limited decrease for branch 21. Branch 26 represents 48.4 % of the total, branch 23 27.5 % and branch 21 24.1 %. Favorable conditions in financial markets allowed the company to offer attractive interest rate guarantees in branch 26, while branch 23 benefited from strongly performing equities markets.

Over-all, branch 21 (combined with the health similar to life business) remains by far the largest of the life branches in terms of premiums, representing 67.5 % of the total premium volume, followed by branch 26 (with 16.4 %) and finally branch 23 (with 16.1 %).

For the life activity (including health similar to life¹²), we then find the following composition of the premium volumes:

¹⁰ branches 21 and 26 provide a technical interest rate guarantee, branch 23 is unit linked business.

¹¹ The remainder belongs to complementary disability insurance

¹² Which also contains the premiums for medical expense insurance.

Gross earned premium 'life' by line of business

	2023	2023	2024	2024	
	Premium volume	% of total (life)	Premium volume	% of total (life)	Change compared to previous year
In '000 EUR					
Line of business					
Insurance with profit participation	414,626.9	76.5%	482,972.1	75.4%	16.5%
Index-linked and unit-linked insurance	72,948.5	13.5%	103,436.0	16.1%	41.8%
Other life insurance	6,386.3	1.2%	5,600.8	0.9%	-12.3%
Health insurance	48,008.2	8.9%	48,557.6	7.6%	1.1%
Total (Life)	541,969.9	100.0%	640,566.5	100.0%	18.2%

The 'with profit participation' insurance remains by far the most important line of business.

A.1.2.2. Significant business or other developments during 2024

Macroeconomic environment and financial markets.

The macroeconomic situation in 2024 was characterized by a number of global challenges. The ongoing war in Ukraine, as well as the further expansion of the conflict in the Middle East, led to a tense geopolitical situation. Shifts in the political landscape increased the volatility in the financial markets. Baloise's insurance business is not directly affected, but the indirect effects on the market environment are further closely monitored. It is clear that our customers, employees and investors can rely on us under these circumstances. Baloise's solid economic substance also endures in this environment.

The lower inflation in 2024 allowed the main central banks to reduce their policy rates, which was also reflected in a steady and significant decrease of the short term market rates. Longer term rates and credit spreads moved more sideways, albeit with some fluctuations during the year. The major equities markets performed strongly in 2024.

Under these challenging circumstances, Baloise remains well positioned thanks to a solid capital base and a long-term investment strategy.

Business environment and corporate strategy.

We live in a transformative time, an era of change characterized by new risks and opportunities (artificial intelligence, changing mobility, increasing electrification, cyber risks, green energy, ...) on the one hand and by fundamental changes in ecological and social condition (nature disasters, politically unstable regions, international migration, impact of social media, stricter regulations ...) and in individual customer behavior on the other hand.

Efforts to further develop IT systems and optimise operating processes allow insurers to increase efficiency, accommodate customer expectations and comply with new legislations and regulations. They also help keeping insurance affordable.

In this environment that is increasingly subject to continuous change, Baloise Belgium NV's strategy emphasizes on strengthening its core business, growing in specific chosen market segments, focus on simple and efficient services, processes and tools and as such delivering an exceptional experience towards our partner-brokers.

The strategy, closely connected to the overall Baloise Group 'Refocusing Strategy' is oriented towards realizing a stable growth of the sustainable earnings, both in the life and the non-life business, with a strong focus on profitability and solvency. This will also assure the efficient investment of the capital provided by the shareholder.

In order to further strengthen our core business we focus on a continuous improvement of our business processes as well as invest in the further digitalisation of the processes within the collaboration with our distribution partners, all this in combination with a simplification of our ICT-landscape.

We strive for an excellent broker and customer experience by pro-actively serving their needs and create a high level of connectivity. Digital communication channels are combined with human contact in a well thought way and are focusing on improving the easiness of doing business with us. The exploitation of data and extracted business knowledge will also become a cornerstone of our business collaboration.

Significant business decisions in 2024

On February 1st 2024, Baloise Belgium NV announced it had entered into a reinsurance transaction with RGA International in view of the optimisation of its 'classic' individual life portfolio in run-off. This run-off portfolio comprises around 57,000 life insurance policies with reserves of some € 900 million. In this reinsurance transaction, all of the portfolio's biometric and financial risks are transferred, while Baloise Belgium NV, in its capacity of insurer, remains the point of contact for customers and partners.

The impact of the transaction on the company's solvency and financial position will be made clear further in the report, in particular where the position at YE2024 is compared to that at YE2023. We remind that, at YE2023, in the run up to the signing of the contract, Baloise Belgium NV had already made certain preparations for this transaction. These included a temporary increase of the volume of cash and short term investment positions in view of the settlement of the initial premium, early in 2024. In the current report, we will refer, where relevant, to this new reinsurance transaction as the '2024 classic life reinsurance transaction'.

Also in 2024, the company decided the far-reaching exit from its marine business under the refocusing strategy.

A.2. Performance of underwriting activities

As disclosed in Baloise Belgium NV's annual report, the company was able to close the year 2024 with a total net profit of € 63.7 million (€ 53.3 million in 2023) while facing a competitive insurance market. In this chapter 'Business & Performance', we will separately look closer into underwriting and investment performance.

In this section, we provide information on the company's underwriting performance over the year 2024 in terms of the contributions from earned premiums, claims and expenses, as measured according to BGAAP. In this section we make abstraction of the investment income, which will be the subject of the next section.

We distinguish between the non-life and the life activity¹³.

A.2.1. Underwriting performance of the non-life activity

A.2.1.1. Aggregate underwriting performance

In the table below, we present the non-life underwriting performance split out by premiums, claims and expenses as aggregated over all non-life and health non-similar to life activities¹⁴. Both the views before (gross) and after reinsurance (net) are shown.

Under 'Annual underwriting result', we show the amount, obtained by deduction of claims and expenses from the premiums earned.

¹³ Where non-life also includes activities qualified as 'health similar to non-life', while other health related activities are represented by the life activity.

¹⁴ Our analyses of the underwriting performances take into account the elements mentioned in the QRT S.05.01.02 (see chapter F. Annexes).

Premiums, claims and expenses - Non-Life aggregated

	2023	2023	2024	2024
	Gross	Net	Gross	Net
In '000 EUR				
Premiums earned	1,499,523.2	1,292,026.5	1,500,624.1	1,359,258.8
Claims incurred	812,356.3	675,592.6	828,775.6	731,575.3
Total Expenses	643,334.3	625,885.7	624,326.5	614,552.1
Annual underwriting result	43,832.7	-9,451.7	47,522.0	13,131.4

The reinsured fraction of the gross premium decreased from 13.8 % in 2023 to 9.4 % in 2024, reflecting the company's increased retention levels in 2024.

The claims ratio, gross of reinsurance¹⁵ increased in 2024 by 1.1 % in comparison to 2023. Net of reinsurance, the claims ratio increased by 1.5 %. We refer to the information per line of business below for more information. Notwithstanding the increased net claims ratio, the higher retention levels (and lower reinsurance premiums) had a positive impact on the technical result.

Due to the update of the cost allocation methodology in 2024 it is not straightforward to compare costs with last year.

All this resulted in an improved net underwriting result over 2024 of €13.1 million (from € -9.5 million in 2023).

We also remind that the aforementioned presentation of the underwriting result makes abstraction of a few technical elements like the changes in other technical provisions, and the variation in the company's provision for equalisation and catastrophes, while these nevertheless contribute to the company's technical result under BGAAP. For the contribution of the non-life investment income, we refer to the section 'Performance from investment activities' below.

A.2.1.2. Underwriting performance by line of business

The table below shows the composition of the total net underwriting result by line of business for 2024, and a comparison with the corresponding total net underwriting result in 2023.

¹⁵ As based on the data in the table above

Premiums, claims and expenses 'non-life' by line of business

	2024	2024	2024	2024	2023
	Net Premiums Earned	Net Claims Incurred	Net Expenses incurred	Net Underwriting Result	Net Underwriting Result
In '000 EUR					
Line of business					
Medical expense insurance	-	7,367.2	2,043.7	-9,411.0	-8,301.2
Income protection insurance	35,469.2	8,851.9	13,990.9	12,626.4	-7,041.8
Workers' compensation insurance	101,187.1	15,736.6	52,787.7	32,662.8	41,988.3
Motor vehicle liability insurance	312,106.6	261,497.0	126,363.4	-75,753.8	-921.0
Other motor insurance	259,969.3	174,796.7	105,148.2	-19,975.7	-28,659.8
Marine, aviation and transport insurance	72,004.6	16,586.0	23,839.5	31,579.1	-2,392.9
Fire and other damage to property insurance	453,765.2	193,664.4	212,913.3	47,187.6	16,361.3
General liability insurance	97,322.3	43,738.7	49,026.0	4,557.6	-2,892.9
Other	27,434.6	9,336.7	28,439.4	-10,341.5	-17,591.7
Total	1,359,258.8	731,575.3	614,552.1	13,131.4	-9,451.7

The following paragraphs give more insight in the results for each of the top 5 lines of business in terms of net earned premium:

Fire and other damage to property

This largest line of business in terms of premium volume has also provided the highest positive contribution to the non-life underwriting result of 2024. Last year Baloise Belgium NV was not affected by major catastrophes. Both claims ratio and expense ratio improved in comparison to 2023

Motor vehicle liability

While the expense ratio for this line of business improved in comparison to 2023, the claims cost increased due to additional provisions the company has made for some adverse claims developments related to accidents in prior years. These provisions also include a contribution for additional costs which are expected to result from a new indicative table, which rates the indemnisation of victims of physical damage incurred amongst other in traffic accidents.

Other motor insurance

The underwriting result of this line of business is still negative but improved in comparison to the previous year, both in terms of claims ratio and expense ratio. The company continues its measures to improve the profitability. This includes amongst others the phasing out of commercial discount campaigns and rate adjustments.

Workers' compensation

The workers' compensation activity continues to provide significantly positive contributions to the net underwriting result, thanks to the company's efforts made in the past to optimize the rate setting and underwriting conditions¹⁶.

General liability insurance

Traditionally, the general liability insurance activity provides quite stable and positive contributions to the company's underwriting results. After having dropped to a negative result in 2023, we see that this activity has well recovered in 2024, thanks to an improved claims ratio, and a stable expense ratio.

A.2.1.3. Underwriting performance by geographic area

The large majority of the company's non-life business is realized in the home country, so the over-all underwriting performance predominantly reflects the performance of the home country business. Nevertheless, the profitability of the business realised in foreign markets is monitored separately, considering the nature of the risks and the distribution approach. For the foreign business, we observed claims ratios which were on average lower than those obtained from the home country business. Expense ratios for the foreign business were in line with those observed for the home country business.

A.2.2. Underwriting performance of the life activity

When assessing the underwriting performance of the life activity, we use a slightly different approach to the one applied for the non-life activity. In addition to premiums, claims and expenses, also changes in other technical provisions are taken into account. These represent the changes in the company's liabilities as a result of premium income and claims payments. The life underwriting performance has to be considered in conjunction with the corresponding investment income, as the latter provides the natural compensation for the growth of the technical provisions according to the applicable technical interest rate and the profit sharing.

¹⁶ The results, shown for 2023 were somewhat biased, due to an underestimation of the allocated expenses.

A.2.2.1. Aggregated underwriting performance

In the table below, we provide the components of the global (aggregated) life underwriting performance, including the health similar to life business.

Premiums, claims, changes in other technical provisions and expenses 'life' aggregated

	2023	2023	2024	2024
	Gross	Net	Gross	Net
In '000 EUR				
Premiums earned	541,969.9	536,564.2	640,566.5	-310,064.0
Claims incurred	636,605.4	632,918.3	758,635.0	642,359.0
Changes in other technical provisions	58,430.1	58,757.2	40,640.7	-800,944.6
Expenses incurred	90,826.8	90,834.5	97,034.6	97,052.2
Other expenses	7,336.6	7,336.6	7,685.0	7,685.0
Total Expenses	98,163.4	98,171.0	104,719.6	104,737.2
Annual underwriting result	-251,228.9	-253,282.3	-263,428.8	-256,215.6

We see that for Baloise Belgium NV's life activity, reinsurance has had a positive impact on the underwriting result in 2024. In particular, the evolution of the reinsured technical provision of the 2024 classic life reinsurance transaction now compensates the growth of the corresponding direct provisions according to the guaranteed interest rate, whereas before this transaction, that growth was compensated by investment income.

The bottom-line figures in the table above do not yet take into account that the changes in technical provisions also comprise changes in the branch 23 provisions which are completely compensated by changes in value of the underlying assets. If we correct the (gross) underwriting results above for this element, we obtain a result of € -185.2 million for 2023 and € -186.7 million for 2024. Hence the corrected underwriting result remains stable.

For contracts covered by the 2024 classic life reinsurance transaction, the charge of the interest rate guarantee is henceforth borne by the reinsurer. For the remaining life portfolio¹⁷, the average guaranteed technical interest rate amounts to 1.54 %, whereas before this transaction, the average guaranteed rate for the whole life portfolio amounted to 1.77 %.

Both in 2023 and 2024, the company also benefited from the exemption of dotations to the flashing light reserve by the NBB, based on a solid Solvency ratio.

¹⁷ i.e. the life portfolio not covered by the 2024 classic life reinsurance

A.2.2.2. Underwriting performance by line of business

Next, we provide some additional information on the underwriting performance of the different lines of business of the life activity.

Insurance with profit participations

This is by far the largest line of business, both in premium volume and in technical provisions. In absolute value, it also provides the largest contribution to the underwriting result in life. Given the large volumes of mathematical reserves it represents, the level of applicable technical interest rate will play an important role in the underwriting result. Other elements impacting the underwriting result are the level of profit sharing, the difference between the mortality rates used for the tariffication of the death or longevity cover and the actually observed mortality rates in the portfolio, as well as the difference between the tariff loadings for expenses (including commissions) and the actually incurred expenses. For the portfolio covered by the 2024 classic life reinsurance transaction, all risks are covered by the reinsurance, apart from the incurred expenses.

Index linked and unit linked insurance

For this line of business, the main element with impact on the underwriting result (after correction for changes in value of the underlying unit-linked assets) is the difference between the tariff loadings for expenses (including commissions) and the actually incurred expenses.

Other life insurance and Health insurance

Here we typically find products which cover biometric risks (like, in particular, death or disability). The underwriting result will depend essentially on the difference between the biometric rates or parameters used for the tariffication of the risk and the actually observed mortality or disability rates in the portfolio. Next, in case, increases or decreases of ageing reserves will also have an impact on the underwriting result of the year, as well as elements like the difference between the tariff loadings for expenses (including commissions) and the actually incurred expenses.

We refer to the table S.05.01.02 in the annexes for more details.

A.2.2.3. Underwriting performance by geographic area

All of Baloise Belgium NV's life activity qualifies as 'home country' activity.

A.3. Performance from investment activities

A.3.1. Review of investment income and expenses

Together with the underwriting income, the investment income will have a strong impact on the company's overall profitability. In particular in the life activity, it provides the natural compensation for the service of the interest guarantee on the customer's technical reserves, which is expressed in the aforementioned underwriting result.

In 2024, the total net investment income, after taking into account investment charges and expenses, and excluding branch 23, contributed an amount of € 194.2 million to the result¹⁸ (compared to € 244.6 million in 2023). We now provide some additional information on the main components of this amount.

The largest part of the company's investment income is recurring. On a gross basis (before investment charges and expenses), the recurring financial income from property, shares, bonds, cash & deposits and mortgages & loans amounts to € 247.1 million, a decrease by 4.6 % since 2023. This decrease reflects the reduction of the company's underlying asset volume after the settlement of the initial premium for the 2024 classic life reinsurance transaction. In the table below, we show the contributions from the main asset classes to the company's (gross) recurring (BGAAP) investment income¹⁹.

Gross recurring investment income from the main asset classes

	2023	2023	2024	2024	
	Recurring investment income	% of sum	Recurring investment income	% of sum	Change compared to previous year
In '000 EUR					
Asset class					
Property	20,049.0	7.7%	21,410.7	8.7%	6.8%
Shares	41,187.9	15.9%	42,439.8	17.2%	3.0%
Bonds	175,133.3	67.6%	152,836.9	61.8%	-12.7%
Cash & deposits	5,117.9	2.0%	5,660.3	2.3%	10.6%
Mortgages & loans	17,487.3	6.8%	24,787.1	10.0%	41.7%
Sum	258,975.4	100.0%	247,134.8	100.0%	-4.6%

¹⁸ According to the income statement in BGAAP.

¹⁹ Recurring income from some smaller asset classes is not presented in the table.

For the bonds portfolio, traditionally the company's largest source of recurring investment income, this income consists of coupons and annual actuarial amortisations. The increase in average return which we observed since 2022, persists, as the company continues to benefit from improving market conditions.

The increase in recurring income from mortgages & loans is explained by higher applicable interest rates and an increase in volume of the underlying portfolio.

The investment income is further also impacted by interest charges, investment expenses, realisations of capital gains and losses, and value corrections²⁰ (impairments and reversals).

As a result of all the aforementioned elements, we obtain a total net investment income of € 194.2 million. The company's long-term vision and prudent investment strategy continues to pay off in an ever changing market environment. Baloise Belgium NV manages its investment portfolio with foresight and with as few fluctuations as possible.

A.3.2. Gains and losses recognized directly in equity

Under BGAAP, there are no gains or losses that are recognized directly in equity.

A.3.3. Investments in financial instruments based on repackage loans

At 31/12/2024, Baloise Belgium NV had no investments in securitisation.

A.4. Performance of other activities

Baloise Belgium NV has no other activities with material income or expenses. It has also no material leasing arrangements.

A.5. Other relevant information

There is no other relevant information to be mentioned. There were no post closing events with relevance for the current report.

²⁰ In 2024, the company realized a net capital loss of € 2.6 million and a net impairment of € 6.3 million on its asset portfolio.

B. System of governance

B.1. General information

B.1.1. Governance structure: overview

B.1.1.1. Board of Directors

The Board of Directors of Baloise Belgium NV has among others the following duties and responsibilities:

Pursuant to article 44 of the Supervision Act, the Board of Directors determines “the strategy and objectives of the company and the risk policy, including the risk tolerance limits and the [...] integrity policy”.

- Firstly, with regard to the company’s strategy and objectives, the Board of Directors shall determine and validate at least the following:
 - the objectives of the company, including the commercial policy;
 - the key elements of its organisational structure and its internal control structure (which should be proportionate to the objectives pursued);
 - the company’s governance policy sensu stricto (in particular the “fit & proper” policy, the remuneration policy, the outsourcing policy, the internal rules on external mandates, the IT security and continuity policy and the charters of the independent control functions);
 - reporting to the public (such as the Solvency and Financial Condition Report or SFCR).
- Secondly, with regard to the risk policy, the Board of Directors must:
 - determine the company’s risk appetite and overall risk tolerance limits (risk appetite policy);
 - approve the company’s general risk management policy and approve the specific risk management policies, namely the following relevant policies (whether or not individually or combined in one or more policy documents): a) the policy relating to the management of underwriting risk and reserving risk, b) the policy relating to the management of assets and liabilities, c) the policy relating to the management of investment risk, d) the policy relating to the management of liquidity risk, e) the policy relating to the management of concentration risk, f) the policy relating to the management of operational risk, g) the reinsurance policy, h) if applicable, the mortgage credit management policy, i) the asset

and liability valuation policy, j) the profit-sharing policy, k) the Own Risk and Solvency Assessment (“ORSA”) policy, l) the capital management policy and m) the policy guaranteeing that the information reported to the National Bank of Belgium is always adequate (article 77, §7 of the Supervision Act);

- being in the front line for strategic decisions regarding risk and being closely involved in the ongoing monitoring of the development of the company’s risk profile (this requires that the board or directors, where appropriate through the audit- and risk committee, has relevant and complete information about the risks faced by the company at all times);
- the approval of the reports to the supervisory authority (the “Regular Supervisory Report” (RSR) and the ORSA);
- Thirdly, the Board of Directors must also approve the company’s integrity policy, which lays down the basic ethical principles of the company and includes at least the following: rules on conflicts of interest, whistleblowing, rules on the prevention of money laundering and terrorist financing, codes of conduct, etc.

Monitoring of the operations:

The monitoring of the operations and the regular assessment of the effectiveness of the company’s governance system are the second major pillar of the Board of Directors’ responsibilities.

This supervision relates to all areas of the company’s activities and, in particular, to the Executive Committee (supervision of the Executive Committee’s decisions) and to the monitoring of the risk policy.

This supervision is carried out in particular through (i) the reporting by the four independent control functions (internal audit, compliance, risk management and actuarial function), (ii) the effective use of the investigative powers of the members of the Board of Directors, (iii) the reporting by the Executive Committee on the development of the company’s activities and (iv) the access to the minutes of the Executive Committee.

Pursuant to article 77 of the Supervision Act, the Board of Directors shall at least:

- assess the effectiveness of the governance system once a year and ensure that the Executive Committee takes the necessary measures to address any shortcomings;
- periodically, and at least once a year, assess whether the company’s four independent control functions are being properly exercised. In addition to the assessment which it can make on the basis of its regular contacts and of the information provided to it by these four functions, the Board of Directors relies on the periodic report of the Executive Committee, which indicates in particular the measures required to remedy any shortcomings. The Board of Directors is obliged to send an

annual report to the National Bank of Belgium on the assessment of the proper functioning of the compliance function. It also ensures that the Executive Committee takes the necessary measures to remedy any shortcomings;

- determine which measures to take in response to the findings and recommendations of the internal audit and ensure that these measures are carried out;
- review the general principles of the remuneration policy on a regular basis and at least annually, and be responsible for overseeing its implementation;
- verify compliance with the policy on reporting to the National Bank of Belgium approved by the Board of Directors pursuant to article 77 §7 of the Supervision Act; and
- be responsible for the integrity of the accounting and financial reporting systems, including operational and financial control arrangements, audit the functioning of internal control at least annually and ensure that these systems provide reasonable assurance on the reliability of the reporting process.

Approval of transactions or projects involving an investment or divestment of at least € 75 million:

In particular, the Board of Directors has the exclusive power to approve all transactions and projects involving investments or divestments of at least € 75 million.

This implies that such transactions and projects shall always require the prior approval of the Board of Directors (without prejudice to all other powers for which the Board of Directors has exclusive competence in accordance with the articles of association, company law and other legal provisions, such as the Supervision Act).

Other:

The Board of Directors is also responsible for the duties and responsibilities reserved to it by Belgian company law and the articles of association. The directors can divide tasks of the Board of Directors among themselves.

Any division of tasks between the directors must always be notified to the supervisory authority. This division of tasks cannot be invoked against third parties, even if it is published.

B.1.1.2. Executive Committee

The Executive Committee, under the direction of Ch. Hamal, is responsible for effective management of the enterprise, and is composed of managing directors, as well as Executive Committee members who are not a member of the Board of Directors.

There is a periodic reporting to the Executive Committee on the main issues and business risks.

The Executive Committee ('directiecomité') has the powers of the management board ('directieraad') as provided for in the Code of Companies and Associations for a public limited company with dual management.

The Executive Committee is, in particular, authorized to perform all acts necessary or useful for achieving the company's objects, except those for which the general shareholders' meeting is authorized by law and without prejudice to the powers reserved by law, the articles of association or otherwise to the Board of Directors.

The Executive Committee has among others the following duties and responsibilities:

- Implementation of the strategy and management of the company as laid down by the Board of Directors:
 - implementing the strategy adopted by the Board of Directors;
 - managing the business in accordance with the strategic objectives set and with the risk tolerance limits laid down by the Board of Directors;
 - supervising line management and ensuring compliance with assigned powers and responsibilities;
 - making proposals and providing advice to the Board of Directors for the development of the general policy and strategy of the company;
- Implementation of the risk management system:
 - translating into procedures and processes the risk appetite framework established by the Board of Directors, the general risk management policy and the specific risk management policies;
 - implementing the necessary measures to control the risk;

- ensuring, on the basis of the reports of the independent control functions, that all relevant risks to which the company is exposed (financial risks, insurance risks, operational and other risks) are properly identified, measured, managed, controlled and disclosed;
 - monitoring the development of the company's risk profile and controlling the risk management system;
- Introduction, follow-up and assessment of the organisational and operational structure:
 - implementing the governance policy sensu stricto (fit & proper policy, remuneration policy, outsourcing policy, internal rules on external mandates, security and continuity policy, integrity policy) defined by the Board of Directors by giving it concrete form in procedures and processes;
 - setting up an organisational and operational structure to support the strategic objectives and ensure consistency with the risk appetite framework defined by the Board of Directors, in particular by defining the competences and responsibilities of each business area and by specifying reporting procedures and lines;
 - setting up appropriate internal control mechanisms at all levels of the company and assess the adequacy of those mechanisms;
 - implementing the necessary framework for the organisation and functioning of the independent control functions and, based on the work of these control functions, assess the efficiency and effectiveness of the risk management, internal control and governance arrangements established by the company;
 - monitoring the correct implementation of the remuneration policy;
 - establishing a system of internal reporting that provides reasonable assurance regarding reliability of financial information and prudential reporting;
- Implementation of the integrity policy defined by the Board of Directors (in particular conflicts of interest, whistleblowing, anti-money laundering and anti-terrorist financing rules, codes of conduct etc.) by giving it concrete form in procedures and processes;
- Reporting to the Board of Directors and the National Bank of Belgium:
 - communicating to the Board of Directors and/or where appropriate, to one of its subcommittees, the relevant information and data to enable them to monitor the company's activities;

- implementing the policy defined by the Board of Directors concerning the reporting to the National Bank of Belgium (article 77, §7 of the Act of 13 March 2016 on the status and supervision of insurance and reinsurance undertakings, “Supervision Act”) and, within that framework, providing the expected prudential reports to the National Bank of Belgium.
- approving the reports regarding the annual and quarterly qualitative statements (QRT – Qualitative Reporting Templates) and submission thereof to the National Bank of Belgium in accordance with article 80, §5 and 202 of the Supervision Act.
- annually and six-monthly declaring to the National Bank of Belgium that the information provided to it in accordance with articles 312 to 316 of the Supervision Act (i) is complete, (ii) correctly reflects the situation of the company, taking into account its risk profile, and (iii) has been drawn up in accordance with the legal requirements and the instructions of the National Bank of Belgium; and
- providing a report on the effectiveness of the governance system to the Board of Directors, the statutory auditor and the National Bank of Belgium at least once a year;
- Approval of transactions or projects involving investments or divestments up to € 25 million.

B.1.1.3. Committees of the Board of Directors (composition, role, activities)

The Board of Directors has appointed the Audit and Risk Committee, the Investment Committee and the Nomination and Remuneration Committee. In the fulfillment of their responsibilities, the members of such committees observe the required objectivity and independence with respect to the Executive Committee.

The **Audit and Risk Committee** has the following tasks with regard to the audit activities:

- monitoring the financial reporting process and the integrity of the financial statements, and make proposals or recommendations to ensure the integrity of the process;
- monitoring the effectiveness of internal control and risk management systems, as well as monitoring internal audit and its effectiveness;
- informing the Board of Directors about the outcome of the statutory audit of the annual accounts and the consolidated accounts and explain how the statutory audit of the annual accounts and the consolidated accounts has contributed to the integrity of financial reporting and what was the role of the audit committee in that process;
- assessing and monitoring the independence of the statutory auditor and of the auditor responsible for auditing the consolidated financial statements, in particular the appropriateness of providing

additional services to the company. More specifically, the audit committee shall analyze with the statutory auditor the threats to his independence and the safeguards applied to mitigate those threats, when the total fees in a public-interest entity referred to in Article 4/1 exceed the criteria set out in Article 4 (3) of Regulation (EU) No 537/2014;

- reporting regularly to the Board of Directors on the execution of its duties, at least with respect to the annual and consolidated accounts and providing periodic information at the end of the financial year and at the end of the first semester;
- making recommendations to the Board of Directors on the appointment of the auditor responsible for the statutory audit of the consolidated financial statements in accordance with Article 16 (2) of Regulation (EU) No 537/2014.

The **Audit and Risk Committee** has i.a. the following tasks with regard to the risk activities:

a) With regard to the risk strategy:

- giving its opinion to the Board of Directors on:
 - the adequacy of the organisation's available resources and capacity for identifying, measuring, managing and reporting the principal risks to which the undertaking is exposed;
 - the appropriateness of the risk monitoring procedure based on the challenges facing the company in its various business lines, and in particular the separation of operational and control functions;
- advising the Board of Directors on all aspects relating to the current and future risk tolerance and risk strategy. The committee shall assist the Board of Directors in overseeing the implementation of this strategy by the Executive Committee or, where appropriate, the effective management;
- ensuring that the strategic decisions taken by the Board of Directors with respect to underwriting liabilities, establishment of technical provisions, determination of reinsurance cessions, investment policy, asset and liability management and liquidity management take into account the risks incurred by the undertaking regarding its business model and its strategy with respect to risks, in particular reputational risks which may arise from the types of products which can be offered to clients;
- determining the nature, extent, form and frequency of information to be provided to the committee on risks;

- collaborating with the nomination and remuneration committee to ensure, in particular, that the total amount of variable remuneration allocated and the performance targets set in the remuneration policy are consistent with the company's risk profile;

b) With regard to the functioning of the risk management function:

- examining the procedures on which the company relies, in accordance with the strategy laid down by the Board of Directors, to cover the risks relating to its assets, its operations and its liabilities resulting from appropriate insurance policies;
- requesting all necessary information (at least the annual report) from the risk management function and be aware of the action plan and the follow-up on this plan by that risk management function;
- hearing the Chief Risk Officer (CRO), advising the board on the organisation of the risk management function and keeping abreast of its work program; where appropriate, requesting the board to impose specific tasks on the risk management function.

The Audit and Risk Committee can receive specific tasks from the Board of Directors, is completely autonomous in the execution of these tasks, and reports regularly to the Board of Directors until its assignment is completed.

The **Investment Committee** has (amongst others) the following tasks:

- validating the investment decisions that (may) contain reputation risks;
- deciding on transactions or projects involving an investment or divestment between 25 and 75 million EUR.

The **Nomination and Remuneration Committee** has the following tasks:

- providing advice on the fit & proper policy and the remuneration policy that must be determined by the Board of Directors and every amendment thereof;
- formally carrying out the fit & proper assessments of new members of the Board of Directors (and of the Executive Committee) and the new persons responsible for the independent control functions;
- monitoring that the fit & proper information submitted to the National Bank of Belgium is complete and accurate;
- periodically assessing the collective expertise of the Board of Directors and the Executive Committee as governing bodies;

- preparing decisions on remuneration, in particular those which have implications for the company's risk and risk management and on which the Board of Directors must take a decision. When preparing such decisions, the nomination and remuneration committee takes into account the long-term interests of shareholders, investors and other stakeholders in the company as well as the public interest;
- preparing decisions with respect to the remunerations of persons responsible for the independent control functions;
- supervising the remuneration of the persons responsible for the independent control functions.

B.1.1.4. Independent control functions

In addition to the aforementioned roles observed by the (executive and non-executive) directors, the company has created four (key) independent control functions, viz. the compliance, risk management, actuarial and internal audit functions. The Executive Committee implements the framework for the organisation and operational adequacy of these functions.

Independence of these control functions comprises the following elements:

- They have an appropriate statute guaranteeing all necessary powers, resources, expertise and access within the organisation including access to the Board of Directors;
- They are hierarchically and operationally independent of the organisational levels they have to control;
- They report both to the executive and non-executive directors in accordance to the established procedures. At least once a year, they report on their activities, on encountered issues and corresponding recommendations, and on their annual planning;
- The remuneration of persons responsible for these functions is from a material point of view not related to the profitability of the activity.

The Executive Committee uses the findings and recommendations of the independent control functions to strengthen the administrative structure, organisation and internal control.

As a part of its supervisory function, the Board of Directors also periodically checks whether the independent control functions are working well.

The four independent control functions are discussed further in this report.

B.1.1.5. Material changes in the governance structure

During the reporting period, the governance structure underwent no material changes.

B.1.2. Remuneration policy

Remuneration principles and objectives

The general remuneration policy is compliant with, and contributes to a healthy and efficient risk management. The remuneration policy and practices are determined and implemented according to the business and risk management strategy, the risk profile, the goals, the risk management practices and the long-term interest and performance of the company as a whole. They comprise measures geared towards avoiding conflicts of interest and undesirable incentives. The remuneration of the members of the Executive Committee is based on value creation and is determined according to the Remuneration Policy of Baloise Belgium NV and the remuneration concept as decided by the Remuneration Committee of Baloise Holding Ltd.

The remuneration policy is designed to take into account the internal organisation of Baloise Belgium NV and the nature, scale and complexity of the risks inherent in the business model and activities of Baloise Belgium NV.

The remuneration policy ensures that the granting of remuneration does not jeopardise the company's ability to maintain an adequate capital base and that remuneration practices do not encourage excessive risk-taking, taking into account the risk management strategy of Baloise Belgium NV.

The success of the company is largely defined by the skills, talents and achievements of its employees. That is why it is essential that it can attract well-educated, skilled and motivated employees and managers, enable them to fully develop and succeed in keeping them on board. The level of remuneration offered by Baloise Belgium NV is in line with the going market rate and is performance-related. Baloise Belgium NV has put in place a remuneration policy that is also compliant with the Baloise Group remuneration policy.

The objectives of the remuneration system are to further increase the emphasis on performance at Baloise Belgium NV, to encourage sustainable business practices, and to strengthen employees' and executives' loyalty and commitment to the organisation.

In addition to paying its staff in line with market rates and according to individual achievement, the company encourages its executives to focus on the longer term and on its shareholder's interests.

Remuneration components

The company's compensation packages consist of the basic salary plus short- and long-term variable remuneration and of other material and immaterial benefits such as pension contributions, additional benefits, and staff development opportunities.

Basic salary

The basic salary is the remuneration that matches the duties and responsibilities of the job in question and the expertise that the employee must have in order to achieve the relevant business targets and objectives. Baloise Belgium NV strives for basic salaries around the market median. In accordance with its Code Of Conduct and Integrity Policy, Baloise Belgium NV applies the principle of equality internally: those who do the same job and have the same qualifications should be paid the same wage.

Variable remuneration

The key factors determining the amount of variable remuneration paid are the global result of the economic value added, and the employee's individual performance. Baloise Belgium NV attaches great importance to sustainable business operations.

In addition to the profit sharing which applies to all staff members (except for the members of the Executive Committee) and depends on the company's profit, the Performance Pool exists. The size of the Performance Pool, which is decided by the Nomination and Remuneration Committee, depends on business performance, the evolution of the share price, risk mitigation and implementation of the strategy, including objective sustainability criteria. It is distributed among the individual staff members qualifying for access to the Performance Pool (in particular the members of the Executive Committee, the members of the management team and the executives). The overall performance assessment (based on performance, commitment, cooperation, leadership and conduct) is the primary tool for determining the amount granted to each individual.

The members of the Executive Committee are, within their variable remuneration of the Performance Pool, obliged to subscribe to shares on a progressive scale: they receive at least 30 per cent of their short-term variable remuneration in the form of shares, which must account for at least 30 per cent of their total variable remuneration (if the long-term effect of the Performance Share Units is included). The shares to which they thus subscribe are restricted for three years and are exposed to market risks during this period. Furthermore, the members of the Executive Committee are awarded Performance Share Units (or PSUs), which are immediately granted, but only vested after 3 years.

Pension schemes

The company offers its employees an attractive occupational pension solution (in the 2nd pension pillar) that meets the following objectives:

- It covers the needs of its insured employees when they retire, die or become unfit for work and mitigates the financial consequences of this with an occupational pension scheme based on the principle of social partnership;
- It allows retired employees to maintain the standard of living to which they are accustomed by guaranteeing them a sufficiently high replacement income (combining benefits in the 1st and 2nd pension pillars) to compensate for their lost income;
- The employer makes a major contribution to the financing of the company pension scheme;
- The pension solutions are future-proof, solid, predictable and cost-effective.

The members of the Executive Committee are insured under a pension scheme, run by Baloise Belgium NV. The other (non-executive) members of the Board of Directors have never been entitled to have contributions paid to the pension fund, nor to have such contributions be paid to them.

Practical implementation

The (annual) determination of (individual and corporate) targets, the performance assessment and the determination of the variable remuneration is controlled centrally through a performance management process.

Baloise Belgium NV provides systems of performance-related remuneration for all of its staff members, although the variable part depends on the group to which each staff member belongs. These distinct groups are the members of the Executive Committee, the Direction Team, the management and executives, the employees and the sales team.

Corporate targets (for Direction Team members and executives) are formulated in terms of measurable quantities like growth rates or combined ratios (as integrated in the business plan which covers 5 years), success in the implementation of the corporate culture, the realisation of team and individual targets and personal development.

B.1.3. Shareholders

Group structure and shareholders

Baloise Belgium NV is an (indirect) subsidiary of Baloise Holding Ltd. and is part of the Baloise Group (Switzerland).

The shareholder of Baloise Belgium NV is²¹ Baloise Holding AG, a company incorporated under Swiss law whose registered office is at CH-4001 Basel, Aeschengraben 21.

Baloise Group, headquartered in Basel, Switzerland is a European financial services provider that offers insurance and pension solutions and is distinguished by its 'Simply Safe' approach. In addition to the Swiss and Belgian subsidiaries, the Baloise Group also has subsidiaries in Germany, Luxembourg and Liechtenstein. The shares of Baloise Holding Ltd are listed on the SIX Swiss Exchange, in the Main Market Segment.

Material transactions with shareholders

Over the reporting period, Baloise Belgium NV engaged in no new material transactions with Baloise Holding AG.

The existing reinsurance transactions and transactions relating to shared operational costs, the latter mostly for services delivered in the area of ICT, were continued in 2024.

Further, Baloise Belgium NV renewed the senior loan to Baloise (Luxembourg) Holding SA granted during the reporting year 2019.

B.2. Fit and proper requirements, transactions with leaders

B.2.1. Fit and proper requirements

Fit and proper principles and objectives

The company has a fit and proper policy that describes how to verify the expertise and reliability of the people who actually run the company or hold key functions.

²¹ Baloise (Luxembourg) Holding SA and Baloise Versicherung AG transferred their shares of Baloise Belgium NV to Baloise Holding AG on March 27th, 2024.

The incumbents of positions to whom this policy applies include the members of the Board of Directors and the Executive Committee, as well as the persons responsible for risk management, compliance, the actuarial function and internal audit.

Assessment process of key personnel

Fitness check

Recruitment and appointment processes include selection and assessment methods that ensure that account is taken of previous experience, qualifications, professionalism, knowledge and skills, purposefully focusing on the competencies laid down in the job description or job profile.

Attention is paid to ensuring that the management bodies have sufficient expertise and experience to comprehend the company's business activities, strategic initiatives and major transactions and to assess them critically.

The collective knowledge, skills and experience of the management bodies ensure that they are aware of and have an understanding of:

- The broader business, economic and market environment in which the company operates;
- The company's business strategy and business model;
- The system of governance (risk management, supervision and controls);
- The financial and actuarial analysis;
- The regulatory framework, and the corresponding requirements and expectations;
- Risk management, compliance and internal audit;
- Information technology and security;
- Climate and environmental risks;
- Local, regional and mondial markets;
- Money laundering and terrorism financing risks;
- Management of international groups and risks relating to group structures.

External and internal candidates for positions that fall within the scope of the fit & proper policy are assessed on the basis of the specific requirements set out in the job description.

Propriety check

The company prescribes a series of specific controls for verifying whether the candidate is honest, sincere and financially independent, and whether he/she has a good reputation.

The company attaches a number of requirements to the recruitment of new employees or to internal promotions. Before it offers the candidate an employment contract, the HR Department asks him/her to submit the documents required for the aforementioned controls and goes through them. The employees who verify the candidate's reliability during a one-to-one interview draw up a formal report of that interview.

The principles applied during the selection process to ensure that the incumbents of critical positions are honest and financially independent, and have a good reputation, continue to remain in full force beyond the recruitment.

All incumbents of critical functions are required to undergo a Code Of Conduct training relating to subjects such as applicable regulations, insider trading, money laundering practices and other topics. The compliance function regularly organises these trainings on the Code Of Conduct.

The fit and proper policy prescribes initial and annual assessments.

The appointment of members of the Board of Directors and the Executive Committee is based on a number of key requirements to ensure a sufficient mix of qualifications, competences and relevant expertise is available to fulfil their responsibilities. Further, annual assessments, based on a 'skills matrix' are made in order to assure the collective presence of the required knowledge and experience in the aforementioned committees.

B.2.2. Loans, credits, guarantees and insurance contracts for leaders

Baloise Belgium NV can directly or indirectly provide loans, credits or guarantees to, and conclude insurance contracts for members of the Board of Directors and members of the Executive Committee or their spouses, partners and first-degree relatives, subject to the usual market conditions, amounts and guarantees. The granting of these loans, credits and guarantees must be reported in advance to the Nomination and Remuneration Committee if they amount to more than € 100,000 on a cumulative basis for a specific person, company or institution.

No loans, credits or guarantees may be granted, directly or indirectly, not even through a credit or bail-in insurance contract, to persons that enable them to subscribe to shares or other securities that provide a direct or indirect entitlement to dividends of the insurance undertaking or of a company with which there is a close connection or which confer the right to acquire such shares or other securities.

During fiscal year 2024, there were no material transactions of these types with members of the Board of Directors, members of the Executive Committee, or their spouses, partners and first-degree relatives.

B.3. Risk management system including the ORSA

B.3.1. Risk management system

B.3.1.1. Description of the risk management system

Risk management is one of the core capabilities of Baloise Belgium NV. The company has developed appropriate strategies, organisation structures, models, and decision and reporting procedures in this area in order to meet the requirements resulting from its continuously evolving activities.

Its risk management approach is based on a sound and comprehensive risk management system, which is founded in the company's overall business strategy. It is adapted to the size and nature of its activities, reflects the overarching risk strategy of the Baloise Group, and is embedded in its own solid governance structure.

The risk strategy and risk appetite

The risk strategy is the basis of Baloise Belgium NV's risk management system. It is aligned with the general corporate strategy, and aims to limit the risks the company is exposed to within defined bandwidths. The risk strategy thus serves in particular the balance between business-based considerations on the one hand and risk-managing considerations on the other.

The central concept of the risk strategy is the risk appetite, which describes the extent of Baloise Belgium NV's willingness to take risks in the pursuit of its strategic objectives. The main components of the risk appetite include

- compliance with regulatory requirements;
- capital protection;
- protection of the income statement.

While accepting significant volumes of underwriting risk as its core business, Baloise Belgium NV only tolerates low levels of investment and operational risks, including reputation risk, with exposure to compliance risk being kept at an absolute minimum.

In order to implement these levels of risk appetite, the company has established a broad limit system, which covers areas like underwriting, investment, and general operational processes, but also the capital

management of the company. Together with the defined control mechanisms, including the company's comprehensive internal control system²², and the reporting procedures, this limit system is a key element in the company's risk management system, in view of the adequate identification, measurement, monitoring and mitigation of all material risks.

The Policy Framework and the policies

The company's Policy Framework is another key element in its risk management system. This framework contains all written policies that provide the high-level principles according to which the company organises its activities, both in addressing the risks it is exposed to and in organising its functions, responsibilities and tasks in general. Furthermore, these policies fully comply with standards and policies issued at the level of the Baloise Group.

Baloise Belgium NV's policies typically contain general, more abstract rules and guidelines, which are further translated into processes and procedures. All policies within the Policy Framework are reviewed on an annual basis, so that elements like underwriting limits, referenced legislation and policy ownership are kept up to date. The reviewed policies of the Policy Framework are finally approved by the Board of Directors.

The conceptual frameworks underlying Baloise Belgium NV's risk management system

A key methodological element in Baloise Belgium NV's risk management system is the Baloise Risk Map below, which contains a complete set of risks that are categorised at different levels of aggregation. It provides the basic taxonomy the company uses for the identification, assessment, monitoring and mitigation of the risks it is exposed to. The high granularity at the basic level of the 'stand-alone' risks supports a deep and broad integration of the risk management activity throughout the different levels and domains of Baloise Belgium NV's activities. The Baloise Risk Map is regularly updated depending on changes in the risk environment.

²² ICS' abbreviated.

	Risk Reporting	

The Solvency II standard formula, which is used by the company for regulatory purposes, provides an additional framework which is in particular useful for the measurement of risks, from the point of view of quantitative risk management at the level of the higher aggregations of risks and capital management in relation to the company's overall risk position.

Procedures of risk identification, measurement, management and reporting

In order to monitor and manage the risks listed in the Baloise Risk Map, Baloise Belgium NV has implemented its comprehensive risk management system throughout its whole organisation. This forms part of a holistic framework where, apart from the risk management system, also the internal control system and the compliance activities play an important role in providing an overall protection against risks. Evidently, in addition to purely financial and business risks, also operational and strategic risks as well as reputation risks and compliance risks are recorded and assessed.

A central role in this risk management system is played by the yearly risk assessment on the basis of the Baloise Risk Map. This assessment is part of the overarching risk management process, which involves representatives of the operational departments in the first line of defence, viz. the 'risk owners' and 'risk controllers' for the identification, assessment, monitoring, mitigation and reporting of the individual or so-called 'stand-alone' risks the company is exposed to. In this yearly exercise, the expected likelihood and possible impact of each risk are rated on a scale from 1 to 4. The impact is rated on both financial and non-financial criteria. On the basis of its rating, each risk is mapped in a heat map. This allows a standardised classification and reporting of the risks, ranging from low, over medium and high, to critical, and, under well-defined conditions, the initiation of an escalation process. The risk management function thoroughly reviews and consolidates the assessments made by the 'first-line' operators.

The aforementioned risk assessment is further complemented with two additional assessments, which are also performed on an annual basis and which are prepared by the risk management function. First, there is the 'top-down' assessment of the strategic risks, based on the views of the members of the Executive Committee. These strategic risks are evaluated in terms of likelihood and potential impact on the company's business plan. Secondly, the Executive Committee also identifies the emerging risks in terms of potential impact and expected time when the risks will become relevant for Baloise Belgium NV.

The risk management function, as a part of the 'second line of defence'²³ controls and integrates the reported risk position.

At the higher level of the aggregated risk categories and the capital position, the quarterly official solvency reporting process provides essential input on the company's global risk and solvency position. This information is supplemented by intermediate, monthly estimates and by a comprehensive annual assessment of the company's risk and solvency position in the ORSA process (see below).

Adequate reporting processes, covering the aforementioned risk measurement and assessment procedures as well as the comprehensive internal control system, are in place, guaranteeing that the Board

²³ The risk management, compliance and actuarial functions constitute the second line of defense. Internal audit constitutes the third line of defence.

of Directors²⁴, the Executive Committee, the risk management function and the Asset Liability Committee and Risk Committee (hereinafter called 'ALCO-RICO') receive all relevant information allowing to monitor the company's risk position.

B.3.1.2. Integration of the risk management system in the organisation structure and the decision process

Strategic choices regarding risk and capital management are integrated into the corporate strategy. When formulating the business strategy and its translation into business practice, for instance in business plans, the principles of risk management and the risk tolerance limits are complied with. The Executive Committee, which the Chief Risk Officer (CRO) is a member of, oversees compliance with criteria regarding the types of risks the company is prepared to accept, the profitability of the operations, and the above-mentioned limit system.

The strategy for managing the 'stand-alone' risks according to the Baloise Risk Map is also fully integrated into the company's organisational structure.

The established procedure for the decision-making process ensures that the various elements of the risk management system are respected. Here, the ALCO-RICO plays a central role. In this advisory body, representatives of the risk management function, the actuarial function, the Finance department and other relevant departments periodically discuss the company's risk and solvency position. The ALCO-RICO provides risk-related input to the Executive Committee on all decisions to be made in matters with a potential significant impact on the company's risk position.

Risk management is thus consistently embedded in the decision-making processes.

B.3.2. Own risk and solvency assessment

Goals, procedure and frequency of the company's ORSA process

Baloise Belgium NV has developed its Own Risk and Solvency Assessment ('ORSA') process in view of the regular assessment of its current and future risk position and solvency needs, and more generally with the objective to create risk and solvency-related input to support its strategic business decisions, including its business planning activity.

The latter highlights the close connection between the company's capital management and its risk management system. Indeed, in the ORSA process, the company determines its future capital needs on

²⁴ Often through the Audit and Risk Committee.

the basis of its future risk exposure, as projected in line with the company's business planning assumptions. In turn, these projected capital needs provide crucial input for the development of the company's business strategy and planning, which also includes capital planning.

The principles underlying the ORSA process are inscribed in the company's ORSA policy. The regular ORSA process is performed on an annual basis by the risk management function²⁵. The results are presented in a written ORSA report which is discussed with, and reviewed by the Executive Committee and the Board of Directors, taking also into account the included statement of the actuarial function and the advice of the ALCO-RICO. The Board of Directors approves the report.

As a result, the relevant information from the ORSA process reaches the competent decision levels within the organisation, and appropriate action is guaranteed whenever the ORSA report might reveal a need for this.

The ORSA process comprises among others

- The verification of the continuous compliance with the regulatory requirements regarding technical provisions and solvency capital, as well as with the company's own risk appetite, and this under normal and stressed conditions;
- The assessment of the own solvency needs given the company's risk profile;
- The assessment of the sensitivity of the solvency position to a broad range of factors and circumstances covering i.a. market risk and climate change risk;
- The definition, quantification and assessment of stress test scenarios which are relevant in view of the company's risk position and which show its resilience under coherent sets of stressed risk factors²⁶ and subsequent reactive actions from the company's management. The risk management function identifies and defines scenarios in collaboration with the Board of Directors and the Executive Committee.

The company has validated the appropriateness of the assumptions underlying the Solvency II standard formula for its proper risk profile. It considers the global regulatory capital requirement as a relevant indication for its solvency needs.

²⁵ If certain developments occur with an impact on the company's risk profile or solvency position, the company will analyze the situation and activate an additional 'non-regular' ORSA process if this impact is considered as substantial.

²⁶ In 2024, the company's stress test scenarios mainly focused on the occurrence of geopolitical tensions, leading to a surge in inflation and adverse evolutions in financial markets, and this in combination with a decrease in underwriting profitability.

During the ORSA process, systematic interaction takes place between the risk management function and the management, for instance in view of the business planning and monitoring activities and with respect to stress-testing.

Determination of the own solvency needs in function of the risk profile and the capital management

The company specifies the relationship between its risk profile and its capital needs in its 'Risk Strategy, Risk Appetite & Capital Management' policy. In the first instance, the company determines its solvency and capital needs in terms of the capital requirement as based on the Solvency II standard formula. In addition, according to internal risk management guidelines, the capital position has also to comply with the capital requirements from the 'Swiss Solvency Test'²⁷ framework. In cases, however, where the company's analyses would indicate that its risk profile represents an excess of risk exposure in comparison to the assumptions underlying the standard formula, the capital needs would be adjusted accordingly.

B.3.3. Risk management function

Baloise Belgium NV's risk management function operates directly under the responsibility of the CRO and has the following responsibilities:

- To collect, aggregate, assess, manage and report all relevant data with respect to significant risks the company is exposed to;
- To participate actively in the definition of the risk strategy in alignment with Baloise Group's strategy;
- To participate in all management decisions that have a significant impact on the company's risk position;
- To provide a complete overview of the risks the company is exposed to.

This further includes:

- To assist the Board of Directors²⁸, the Executive Committee and the other involved functions in view of the efficiency and uniformity of the risk management system;

²⁷ These Swiss Solvency Test (SST) calculations are also required for Baloise Group, given that the latter has to comply with SST based capital requirements.

²⁸ And, if relevant, the Audit and Risk Committee.

- To define and implement risk measurement methodologies and control processes in compliance with the regulatory requirements and in line with the approach of the Baloise Group;
- To implement the company's risk management system and monitor the general risk profile;
- To assess and report, both regularly and ad hoc, on the company's risk exposure, and to escalate the matter in case of a critical risk;
- To advise the Board of Directors and the Executive Committee on risk-related matters;
- To identify and assess new and emerging risks;
- To support the activities of the risk and solvency-related advisory bodies within the company;
- To coach the company's staff and to raise risk awareness among them;
- To fulfil regulatory requirements and take care of the contacts with the supervisor.

B.4. Internal control system

B.4.1. Overview internal control system

Within the company's integrated and company-wide risk management approach, the internal control system (ICS) plays a central role. It contains a broad range of implemented control measures and processes that are effective, traceable and efficient.

In accordance with its internal control policy, Baloise Belgium NV's internal control system must, under the responsibility of the management, allow reasonable assurance over the following areas:

- The conduct of business is well-organised and prudent, with clearly defined goals;
- The company's resources are used economically and efficiently;
- The risks are known and adequately managed from the viewpoint of protection of the capital;
- The financial and management information is integer and reliable;
- The laws, regulations, general policies, plans and internal guidelines are observed.

The Board of Directors and the Executive Committee see to it that an adequately functioning internal control system is established and that the necessary resources are available. Strategy and objectives are clearly defined in the company's internal control policy.

The company's internal control system covers the company-wide operational risks, which also traditionally includes risks related to the financial reporting process. The focus lies on the key risks and a distinction is made between risks in the business processes (covered by process controls), risks related to ICT systems (covered by IT general controls) and more general risks for the company as a whole (covered by entity level controls). In this way, the ICS is complementary to the assessments of, and reporting on the risks represented in the Baloise Risk Map, and the compliance risks.

A systematic annual risk-scoping guarantees that the ICS stays up to date in view of the continuous changes in the company's processes. For each process, comprehensive documentation is available. The effectiveness of the installed controls is also assessed annually by the management and appropriate measures are taken in case deficiencies are revealed. The annual reporting process on the applied controls and their effectiveness is supported by a dedicated reporting tool. The report is provided to the Executive Committee and the Board of Directors, who closely monitor the results and take appropriate measures if necessary.

B.4.2. Compliance function

The compliance function is a key function within Baloise Belgium NV's integrated risk management approach. It acts under the hierarchical responsibility of the CRO, and its main features have been summarised in the compliance function charter.

Tasks of the compliance function

The compliance officers permanently monitor and promote compliance with the regulations and company standards, which is necessary for the preservation of the public trust, integrity and good reputation of the company.

By monitoring the company's residual exposure to compliance risks, the compliance function provides an important contribution to the company's entity-wide risk management.

The compliance function also provides a yearly measurement and assessment of the compliance risks along the main identified compliance themes. The results are reported to the Executive Committee, the Risk and Audit Committee and the Board of Directors.

On an annual basis, the compliance function also reports to these bodies on its planning and its activities.

Implementation throughout the organisation

The compliance function is exercised independently from the operational and other control functions, and follows a proactive and preventive approach.

Practical implementation of the compliance activity is realised in collaboration with the compliance partners. These are staff members from other departments which are designated to act as a point of contact for the compliance function, and to support the elaboration of the compliance principles and requirements within their own department.

Further, the compliance function interacts on a regular basis with other relevant functions such as the other control functions, the Baloise Group Compliance Officer, the DPO, the Complaints Officer, the Deputy FATCA Officer and the compliance partners.

B.5. Internal audit function

B.5.1. Organisation and governance

Baloise Belgium NV's internal audit area covers the systematic assessment of the adequacy and effectiveness of the company's processes and of the elements of risk management, internal control and governance.

Baloise Belgium's internal audit function follows the requirements of the law dated 13/03/2016 on the status and supervision of insurance or reinsurance companies ('Solvency II Law') and the circulars of the National Bank of Belgium (NBB), in particular the overarching Governance Circular NBB_2016_31 revised in May 2020, and NBB_2015_21 on internal control and the internal audit function.

On the one hand, the internal audit function controls and ensures that the operational processes take place as intended and so supports the achievement of the company's objectives.

On the other hand, findings are made to improve the quality and effectiveness of these processes.

Internal audit works in accordance with the mandatory elements of The Institute of Internal Auditors' International Professional Practices Framework, which are the Global Internal Audit Standards and Topical Requirements and the Baloise Group Internal Audit Standards. The principles governing the company's internal audit approach are inscribed in the company's internal audit policy and in its internal audit function charter.

The internal audit function is authorised to perform audits throughout Baloise Belgium NV's organisation, which includes its subsidiary companies. It possesses extensive, unlimited rights to information, inspection and control, which are necessary for it to fulfil its assignments. A system of close follow-up of its findings guarantees the effective remediation of identified issues.

The establishment of the annual audit planning is essentially risk-driven, and takes into account input obtained from sources like the risk assessments, strategic dialogues with (key) stakeholders (interviews

with (Executive) Directors; Chairman of the Audit & Risk Committee and Chairman of the Board of Directors), Internal Audit Watchlist and external benchmarking with global trends and challenges in the financial industry / insurance. The local audit planning is arranged in consultation with Balaise Group Internal Audit (GIA) for identification of group-wide audits and potential for group-wide cooperation.

The Head of Internal Audit shares information and coordinates activities with other internal and external providers of assurance and consulting, including the other independent control functions within Balaise Belgium NV's organisation.

B.5.2. Independence of the internal audit function

The internal audit function is organisationally independent of the operational business activities. The Head of Internal Audit/Chief Audit Executive (CAE) reports to the Chairman of the Executive Committee for assistance in establishing direction, support, and administrative interface; and to the Audit and Risk Committee for strategic direction, reinforcement, and accountability. It has unrestricted access to the Audit and Risk Committee, the Board of Directors, and the Executive Committee. The Head of Internal Audit/CAE always has the opportunity to contact the Chairman of the Audit and Risk Committee, the approved statutory auditor or the supervisory authority directly, i.e. without prior consultation with the Executive Committee, on its own initiative, whenever it deems this necessary. The Head of Internal Audit/CAE annually confirms the operational independence of the internal audit function to the Audit and Risk Committee.

The Chair of the Audit and Risk Committee provides input to the CEO and the remuneration committee to support the performance evaluation and compensation of the CAE.

B.6. Actuarial function

Within Balaise Belgium NV's governance framework, the actuarial function has several responsibilities. This includes the coordination of the calculation of the technical provisions and the assessment of the overall underwriting policy, the reinsurance program and the profit-sharing program (and the reporting of its opinion thereon). The actuarial function also contributes to the effective implementation of the risk management system. The actuarial function formulates recommendations in specific projects related to product development.

The principles on which the organisation and implementation of this function are based, are inscribed in the company's actuarial function policy and actuarial function charter. The actuarial function is exercised independently of hierarchical and organisational levels of the activity lines and the revenue-generating departments it has to control.

It undertakes its duties in an objective and fair manner, and is also subject to the company's fit and proper requirements.

The actuarial function works in close collaboration with the other control functions. It has direct access to the Board of Directors and the Executive Committee, to which it also provides its opinions.

B.7. Outsourcing

Baloise Belgium NV is of the opinion that the outsourcing of certain activities or functions can be beneficial for the company. However, outsourcing decisions are always subject to strict conditions which are specified in the company's outsourcing policy.

According to this policy, each possible outsourcing of critical or important services or activities has to be thoroughly analysed before the decision to enter into an outsourcing agreement can be taken. A strict procedure and governance have to be complied with, both during the preparation and the execution phase of the outsourcing.

For strategic activities, the approval of the Board of Directors is required, and in all cases, Baloise Belgium NV remains responsible for the provided services and activities. External service providers must not only prove their financial and operational solidity, they must also have reliable internal control procedures, and the quality of their processes and systems has to guarantee compliance with Baloise Belgium NV's requirements in terms of IT security, data protection and confidentiality.

A written agreement must not only specify the execution modalities like service level agreements and accessibility of information, but it must also allow an orderly return of the activity to Baloise Belgium NV in case of cancellation or a transfer to another service provider.

For each outsourced function or activity, an outsourcing owner is designated. The latter is responsible for the monitoring of the service provider's performance and results during the whole duration of the outsourcing contract. For critical or important outsourcing agreements, an annual control and assessment procedure with standardised reporting is implemented. This procedure includes an updated analysis of the risks related to the outsourcing, and a reporting and assessment of the controls performed by Baloise Belgium NV on the external provider, his performance and governance. This annual control and assessment procedure of the outsourcing agreements has been integrated in the company's internal control system.

The following list shows the critical or important activities that were outsourced on 31/12/2024:

Outsourced critical or important activity	Area	Internal/ External	Jurisdiction of service provider
Acceptance, pricing, contract management and/or claims handling (several service providers)	Business	External / Internal	BE/NL
Administration and claims handling hospitalisation	Business	External	BE
Agile insurance platform and hosting	ICT	External	FI
Biztalk monitoring and integration services security	ICT	External	BE
Central printing	Gen. services	External	BE
Customer communication management	ICT	External	BE
Customer identity & access management	ICT	External	NL
Document management	Gen. services	External	BE
Financial collections	Business/Fin.	External	BE
ICT systems, applications and services - hosting and data center services	ICT	External / Internal	BE/BG/CH/ES/FR/IE/LU/NL/PL
Investment advice (quoted securities)	Asset mgt.	Internal	CH
ICT network management	ICT	External	BE
Real estate management	Asset mgt.	External	BE
Roadside and home assistance	Business	External	BE
Telephone services management	Gen. services	External	BE

B.8. Other relevant information

Baloise Group has a sustainability network in place. It consists of representatives from all Baloise business areas with the necessary knowledge to develop and update the content of the sustainability strategy regularly. Baloise Belgium NV is equipped with a local sustainability network for the operative implementation of the sustainability strategy.

C. Risk Profile

Overview

The main sources of risks impacting Baloise Belgium NV's non-life insurance underwriting activity are related to natural disasters and other catastrophic events, major industrial risks, liability risks and personal injury risks. Baloise Belgium NV analyses these risks on a regular basis, in collaboration with Baloise Group, and with reinsurance companies and brokers, in order to determine its exposure and the necessary degree of risk transfer. The results of these analyses are taken into account in product design, in pricing and reserving, and in reinsurance decisions.

In the life activity, the pricing of biometric risks (mortality, longevity and disability) can usually be based on reliable statistical information from the market. In the current climate of volatile market interest rates, the management of the interest rate risk in relation to the life activity receives continuous attention.

With respect to its investments, Baloise Belgium NV considers the credit spread risk and the property risk as its most substantial market risks.

In addition to the aforementioned sources of risk, which belong intrinsically to the company's core activity, the company has also to take into account risks which it would prefer not to take at all, but which are an unavoidable consequence of its operations. Here we mention e.g. the operational risk, but also the compliance and reputation risks.

The management of the risks the company is exposed to, is strongly embedded in its governance system. This governance system provides a general framework which comprises a number of risk management instruments and processes that together address the company's total risk position:

- Written instructions for operational activities, including policies, procedures and manuals, which are the translation of the company's risk strategy and appetite, and keep the risk exposure within acceptable limits.
- The Internal Control System which guarantees being compliant with, and applying correctly the aforementioned instructions.
- A yearly assessment of the company's exposure to the individual (or stand-alone) risks according to the Baloise Risk Map, by risk owners and controllers in the business departments. These representatives of the first line of defense also identify, implement and monitor appropriate risk mitigating measures. Next, aggregation, second line assessment and further reporting are performed by the risk management function. These assessments of the stand-alone risks are

complemented with an assessment, by the members of the Executive Committee, of the strategic risks and the emerging risks.

- Quarterly comprehensive quantitative assessments for the different risk categories based on the Solvency II standard formula, with monthly intermediate estimates of the solvency ratio.
- Periodic reports on specific risks, which allow to monitor the evolution of the exposure to, or the impact of these risks.
- A yearly assessment of the company's resulting risk profile, as a part of the ORSA process; this also includes the monitoring of compliance with the regulatory and internal, risk appetite based requirements.

We now provide more specific information on the risk exposure and management by risk type.

C.1. Underwriting risk

C.1.1. Underwriting risk non-life

C.1.1.1. Risk Exposure

The majority of the insurance risks underwritten by Baloise Belgium NV cover individuals and small and medium-sized companies. However, the company also covers larger corporate clients.

Premium and Reserving Risk

Premium risk relates to an inadequate coverage of the claims charge by premium income, while reserving risk occurs when technical provisions appear to be insufficient to settle the ultimate claim charge.

The motor vehicle liability activity represents by far the largest exposure to the combined premium and reserving risk (as measured by the corresponding capital requirement). This is not surprising, given that this is by far the largest non-life line of business in terms of net technical provisions for outstanding claims, with long development patterns for claims handling, and the second largest in terms of net premium volume.

Other lines of business with material, although lower exposures to the premium and reserving risk are the fire and other property damage, third party liability, other motor, and marine and transport activities ('MAT'). The exposure to MAT decreased over 2024, as a result of the company's far-reaching exit from its marine business under the refocusing strategy.

Catastrophe Risk

Catastrophe risk is the risk that a single event, or a series of events over a short period, results in a significant adverse deviation of the claims volume from the expectation. The main source of exposure to catastrophe risk for the company is the risk of natural catastrophes, which includes, in decreasing order of importance, windstorm, flood, hail, and earthquake risk. Drought risk is also receiving more and more attention.

Lapse Risk

Lapse risk is the risk that more profitable policies are terminated earlier than expected, essentially as a result of early termination by the policyholder. In this case, the company faces a decrease of its expected profits. This risk increased during 2024 as a result of change in legislation.

Assessment of the risk exposure

Based on results obtained by the application of the Solvency II standard formula, we see that the company's exposure to the premium and reserve risk is significantly higher than that to the catastrophe risk (after reinsurance) and the lapse risk.

C.1.1.2. Risk Concentration

Risk concentration can apply to geographic concentration, e.g. in case of elementary damage scenarios like floods or windstorms, but e.g. also to single large customers or buildings.

C.1.1.3. Risk management and mitigation

Baloise Belgium NV has a broad range of practices and measures to manage and mitigate its non-life underwriting risk. Strict profitability criteria apply for the product development and pricing process, based on reliable data and thorough risk analyses. Various analyses and studies (including with Baloise Group) support these activities. Clear underwriting instructions have been developed in terms of which types of risks qualify for acceptance, and in terms of underwriting limits with respect to amounts insured. In this way, excessive exposures, or exposures to unwanted or unknown risk types are avoided.

A close follow up of the underwriting results guarantees that insufficient premium levels will be detected quickly and that the necessary measures are taken.

The company also monitors and manages the concentration of risks in its portfolios by procedures like the measurement of its exposure by geographic region, but e.g. also by the aggregation of its risks exposure by customer.

The reserving risk is also kept well under control, thanks to prudent reserving procedures and a close follow up of the development of outstanding reserves.

Further, reinsurance is the main risk mitigating technique for the company's exposure to the non-life underwriting risk and the related concentration risk.

Baloise Belgium NV's reinsurance program covers both exposure to large claims and accumulation of claims (e.g. due to catastrophe events) and it is developed in close collaboration with Baloise Group. It is built around four blocs: property, liability, marine and persons. It comprises a balanced combination of reinsurance contract types including excess of loss covers and facultative reinsurance.

C.1.1.4. Risk sensitivity

Sensitivity to the underwriting risk in non-life can, among others, be derived from the application of the solvency II standard formula. Taking into account the implemented risk mitigating measures and in particular the reinsurance strategy, the remaining impact the underwriting risks can have, is limited. Typical losses (even if calibrated in line with the standard formula) represent only a limited fraction of the company's own funds, so that the capital position remains clearly above the regulatory solvency requirement.

C.1.2. Underwriting risk Life

C.1.2.1. Risk Exposure

Traditionally, in life insurance, fixed sums are paid based on terms and conditions agreed upon at the start of the contract. Baloise Belgium NV's life insurance portfolio contains several types of contracts, which expose the company to several different components of the life underwriting risk.

Mortality Risk

Mortality risk materializes essentially when real mortality rates in contracts with positive risk capital²⁹ exceed the expected mortality rates underlying the pricing (or the current reserving bases).

Several types of contracts in Baloise Belgium NV's life portfolio, including pure term and mortgage protection insurance, offer death covers, and thus do expose the company to the mortality risk.

²⁹ In cases where the death capital exceeds the contract reserves.

Longevity Risk

Longevity risk occurs when real mortality rates in contracts with negative risk capital are lower than the expected rates underlying the pricing (or the current reserving bases).

Types of contracts that expose the company to longevity risk are e.g. annuities and certain types of classic life contracts like deferred capital contracts.

Lapse risk

Lapse risk occurs when differences between real and expected lapse rates create losses for the insurer. Apart from a few exceptions like annuities, all of Baloise Belgium NV's life insurance contracts can be impacted by the lapse risk.

Expense risk

Expense risk occurs when real expenses exceed those expected according to the pricing (or the current reserving bases). Given the long term nature of some of the life insurance contracts, longer periods of high inflation could e.g. have an adverse impact on the company's future financial position.

In principle all of Baloise Belgium NV's life portfolio is exposed to the expense risk.

Catastrophe risk

The life catastrophe risk corresponds to the occurrence of extreme death events like pandemics which result in large numbers of claims for life contracts.

Again, in principle all of Baloise Belgium NV's life portfolio can be impacted, but losses will be limited to contracts with positive risk capital (and more generally contracts where the termination results in a loss of profits).

Other risks

Further, granting interest rate guarantees, either on vested reserves or on future premiums, exposes life insurers to the risk that future investment returns will not be sufficient to cover the growth of the corresponding reserves. From a methodological point of view, however, this risk is managed as a market risk, rather than as an underwriting risk.

Assessment of the risk exposure

Based on the risk measurements defined by the Solvency II standard formula for capital requirements, we see that, just like at YE2023, the company's exposure to the lapse and expense risk is higher than that to the aforementioned biometric and catastrophe risks (after reinsurance). Overall the life underwriting risk

increased in 2024 by € 10.6 million, driven by an increase of the mass lapse risk. Just like at YE2023, the application of the mass lapse shock leads to a lower net asset value than those obtained from the upward or downward lapse shocks.

C.1.2.2. Risk Concentration

Given the large number of insured persons, and the high degree of independence among them, Baloise Belgium NV considers the level of risk concentration in its life portfolio as limited.

However, large scale factors or trends (e.g. economic and financial circumstances, or changes in lifestyle) could lead to mass lapses or changes in mortality rates.

C.1.2.3. Risk management and mitigation

Much of the aforementioned principles for managing and mitigating the non-life underwriting risks also apply for the life underwriting risk.

So, the use of prudent pricing parameters and contract conditions with respect to biometric parameters, loadings and penalty clauses in case of lapse³⁰ will protect the company against adverse experience.

Further, strict acceptance criteria and limits are in place for the underwriting process, as well as a follow up of the results.

Here also reinsurance remains a relevant risk mitigation technique, covering both large (individual) claims and accumulation of claims. As usual, excess parts of the death and disability risk are ceded to reinsurers, although the proportion of the earned premiums that is ceded to these reinsurers, is much smaller than in non-life. In addition, the '2024 classic life reinsurance transaction' resulted in the transfer of the death, longevity, lapse and catastrophe risk for the contracts in scope. It implied the payment of an initial reinsurance premium (in 2024) and further recurring premiums, based on the direct premiums the company collects. The impact on the life underwriting risk remained rather limited³¹.

C.1.2.4. Risk sensitivity

Sensitivity to the underwriting risk in life can among others be measured by results from the Solvency II standard formula. Based on these results, we see that even when the life underwriting risks are aggregated,

³⁰ Including penalties in function of market interest rates.

³¹ For the impact on market risk, see below.

their impact remains limited. Typical losses, calibrated in line with the standard formula, represent only a limited fraction of less than 12 % of the company's own funds, so that, under the considered assumptions, the capital position remains clearly above the regulatory solvency requirement.

C.2. Market Risk

Market risks are reflected in losses resulting from fluctuations of market prices or other related data which could lead to a potential decrease of the company's own funds.

The potential impact of the risk is dependent on the extent of price fluctuations on the market and the exposed volumes.

According to Baloise Belgium NV's risk strategy and risk appetite statement, the company only accepts a low level of market risk with respect to its investment assets.

This means that the company complies with the prudent person principle in its investment decisions.

The company only invests in assets and instruments of which the risks can be properly identified, measured, monitored, managed and reported. Moreover, these assets have to qualify for contribution to the company's own funds in view of the solvency position.

All assets are invested in such a way as to ensure the security, quality, liquidity, return and congruence of the portfolio as a whole. In addition, risk concentration is avoided and the choice of custodian guarantees their availability.

Baloise Belgium NV's investment decisions have also to comply with its sustainability criteria, with a focus on the Environmental, Social and Governance ('ESG') themes as described in the responsible investment policy.

The assets that cover technical provisions are invested in a manner that is consistent with the nature and duration of the insurance obligations. These assets are invested in the interests of all policyholders and beneficiaries. The use of derivative instruments is allowed, if they reduce risk or facilitate efficient portfolio management.

Investments and assets not traded on a regulated financial market are limited.

Baloise Belgium NV manages its market risk both from a holistic point of view and separately at the level of its different components. Below we discuss the latter one by one and the way they are specifically managed. As a part of its life insurance activity, Baloise Belgium NV also offers unit-linked life insurance contracts. While the investment risk is essentially carried by the policyholder, the company itself also

recognizes a residual risk for potential losses of future income under adverse evolution of the value of the underlying investments.

In view of the following analysis of the company's exposure to the different components of the market risk, and the changes thereof over the reporting period, it is useful to consider the contributions of the different sub-risks to the capital requirement for market risk according to the Solvency II standard formula.

Solvency Capital Requirement : Market Risk (according to Standard Formula)

	2023	2024	Change vs. previous year
In '000 EUR			
Interest rate risk	77,132.0	50,278.4	-34.8%
Equity risk	103,647.3	143,443.3	38.4%
Property risk	210,031.8	208,460.2	-0.7%
Spread risk	237,018.7	233,872.5	-1.3%
Market risk concentrations	-	-	0.0%
Currency risk	31,641.7	43,920.3	38.8%
Diversification within market risk module	-121,253.5	-122,720.6	1.2%
SCR Market risk	538,218.0	557,254.3	3.5%

C.2.1. Risk exposure

C.2.1.1. Interest risk

Interest risk is the risk resulting from changes in interest rates, in the interest rate structure or in the value of instruments based thereon.

These have a direct impact on the value of all interest-sensitive positions within the company's assets and liabilities. Ultimately, interest risk is measured by the impact on the (net) own funds value, resulting from incomplete compensation between changes in market consistent value of assets and liabilities.

The better the duration structure of the asset cash flows matches with that of the liabilities, the less the insurer will be exposed to the interest risk.

Within Baloise Belgium NV's assets, the bond portfolio is the largest interest sensitive asset class.

Still at the asset side, the fair value of loans (mortgages and other) and collective investment undertakings invested in fixed income assets³² also depends on market interest rates, while at the liabilities side, the technical provisions represent the main interest dependent items.

The life activity is more susceptible to interest rate risk than the non-life activity, due to its larger volumes of assets and liabilities.

The aforementioned risk measurements based on the Solvency II standard formula show a decrease of the interest rate risk between YE2023 and YE2024. This shows that the company restored its high level of duration matching after the settlement of the initial premium for the 2024 classic life reinsurance transaction.

C.2.1.2. Equity risk

Equity risk is the risk that arises from adverse changes in the market value of equity investments (or of instruments depending thereon). The higher the volatility of the equity markets the higher this risk is.

The company's equities, including its shares in collective investment undertakings (or investment funds) and its holdings in related undertakings (incl. participations) are in principle subject to the equity risk. However, for investment funds and holdings in related undertakings, the look through approach has to be applied. As a result, the company's participations, invested in property, contribute to the property risk, and similar reallocations of the risk are made for the investment funds in function of their underlying assets. Hence, the evolution of the capital requirement for equity risk will reflect the evolution of the composition of the underlying asset portfolio after application of these reallocations.

The increase of the equity risk over 2024 (as measured by the change of the corresponding capital requirement) is explained by additional investments in equity funds.

C.2.1.3. Property risk

Property risk is the risk that negative developments in the value of property lead to decreases of the company's own fund position. The company considers its property investments as an important source of diversification within its asset allocation.

³² By application of the 'look through' principle, e.g. for Dutch mortgages.

Taking into account the application of the aforementioned look through principle on the company's property participations and investment funds, the total volume of property investments, and hence also the corresponding capital requirement for property risk, remained practically unchanged over 2024.

C.2.1.4. Spread risk

Spread risk is the risk that an increase of credit spreads results in decreases of the market value of certain asset classes, and hence also in a decrease of the company's own funds.

Such increases of the credit spreads could result from deterioration of the credit quality of the issuer, which could be reflected in rating downgrades for specific issuers, or from changes in risk premiums the market requires to compensate for the credit risk.

Baloise Belgium NV considers this risk to be applicable on its bonds portfolio including infrastructure debt as well as on loans, in case also on its term deposits and on certain parts of its investment funds, based on the look through principle.

This risk has to be distinguished from the counterparty default risk. The latter relates to the situation where the default of individual counterparties results in the loss of a fraction (the loss given default) of the nominal outstanding debt or payable of the counterparty in question.

Throughout Baloise Belgium NV's risk assessments and measurements, the spread risk is recognized as one of the highest risks of all, and hence its monitoring and management receive continuous attention.

The measurement of this risk according to the standard formula at 31/12/2024 shows a stable global exposure, notwithstanding some limited changes in the composition of the underlying portfolios. The credit quality is closely monitored and continuously complies with the company's standards.

C.2.1.5. Currency risk

Currency risk is the risk that changes in exchange rates lead to decreases of the company's own fund position. The effective exposure to the currency risk for a given currency depends on:

- The volume of the net exposure i.e. the difference between assets and liabilities held in that currency.
- The volatility of the exchange rate of the currency.
- The correlation of the currency with other risk factors.

The company has some insurance activities with liabilities in USD, but these are continuously covered by congruent assets and leave practically no net currency risk exposure. In addition, the company holds also a (limited) volume of investment positions with underlying assets quoted in foreign currencies, which are unrelated to the aforementioned liabilities and so create a net exposure to the currency risk. In 2024, the company slightly increased its positions in such investments, which explains the observed increase of the exposure to the currency risk.

C.2.2. Risk concentration

In application of the prudent person principle, Baloise Belgium NV diversifies its assets in order to avoid excessive dependence on a particular asset, a particular issuer or group of companies, or a particular geographical area. In this way, excessive risk accumulation in the portfolio can be avoided.

C.2.3. Risk management and mitigation

Interest risk

Baloise Belgium NV actively manages and mitigates the interest risk by controlling and steering the duration structure of its assets in function of that of its liabilities. At YE2023 and further until the settlement of the initial reinsurance premium for the 2024 classic life reinsurance transaction, the company allowed for a limited and controlled temporary deviation from its usual level of duration gap. Even then, the SCR contribution for interest risk represented less than 15 % of whole capital requirement for market risk. After the settlement, the duration gap returned to its usual lower levels.

This reinsurance transaction transferred the investment risk related to the funding of the interest rate guarantee was transferred to the reinsurer for the covered portfolio. It also resulted in a decrease of Baloise Belgium's exposure to market risk for the transferred funds³³.

Finally, the level of technical interest rate guarantees the company offers in its life insurance products is also closely monitored, which resulted in updates of these guaranteed rates for certain products in 2024 in view of the developments of the capital markets. The management of the technical interest rate guarantees does not only apply for new contracts but also for contracts where the current guarantee does not extend to future premiums, and for investment contracts where temporary interest guarantees on constituted reserves expire and are renewed.

³³ Impacting not only interest risk but also other components of the market risk.

Equity risk

Baloise Belgium NV manages its exposure to the equity risk by keeping the corresponding volumes low. At YE2024, assets subject to the equity risk³⁴ represented less than 3 % of the total asset value.

Property risk

The company only invests in low risk and high quality properties, with a focus on recent offices, situated in Belgium, with existing lease contracts and well-established tenants.

Property investment decisions are thoroughly prepared by examining the sustainable profitability of the project, and require approval by the company's Investment Committee.

The management of the property portfolio has been outsourced to a professional service provider in order to maximize investment value and return.

Spread risk

In order to manage the exposure to the spread risk, the company closely monitors counterparty quality. Further, management of the spread risk is integrated in its aforementioned holistic approach for the management of the market risk, which is based on compliance with tolerance levels under specific stress test scenarios

Currency risk

The company neutralizes its risk exposure resulting from insurance liabilities expressed in foreign currencies by holding corresponding amounts of congruent covering assets, i.e. assets quoted in the foreign currency in question. In addition, at 31/12/2024, Baloise Belgium NV held a limited volume of (unhedged) investment assets quoted in foreign currencies (less than 1 % of the total asset value). Baloise Belgium NV's policy is to hedge this currency risk in case the risk level becomes material.

C.2.4. Risk sensitivity

Baloise Belgium NV regularly examines the sensitivity of its capital and solvency position to various market risk factors e.g. as a part of its annual ORSA process.

³⁴ Excluding assets held for unit linked contracts.

For the position at YE2024, the company has measured its risk sensitivities by calculating the immediate impact of the following delta's ('shocks') relative to the central assumptions underlying the officially reported results:

- A decrease of the interest rate curve by 50 bp.
- An increase of the interest rate curve by 50 bp.
- A decrease of equity market prices by 25 % (equity shock).
- An increase of the credit spread by 50 bp³⁵.

Such changes in assumptions lead in general to changes in both the company's own funds position and in the capital required to be held to comply with the Solvency II principles, and hence also in the ratio between own funds and capital requirement (the so called Solvency Ratio)³⁶.

If, in order to measure the sensitivity to the level of interest rates, a downward shift of 50 bp is applied on the yield curve, the solvency ratio decreases to 171.9 % (from 177.7 %) while it increases to 178.3 % if the opposite (upward) shift is applied. Under the assumption of the equity shock (-25 %), applied on the company's equity portfolio, the ratio after the shock amounts to 174.7 %. Finally, the increase of the credit spread by 50 bp results in a solvency ratio of 172.0 %. Here, we have made abstraction from the impact of the increase of the spreads on the volatility adjustment. Under each of these shocks, the change in the company's solvency ratio is such that it would continue to meet the regulatory and internal, risk appetite based capital requirements.

C.3. Credit risk

C.3.1. Risk exposure

Credit or counterparty default risk relates to the potential losses resulting from unexpected defaults or deteriorations of the creditworthiness of the company's counterparties and debtors, that are not taken into account under the credit spread component of the market risk.

For Baloise Belgium NV, the main sources of this risk are exposures to large counterparties like banks (with respect to cash deposits and derivatives) and reinsurers (essentially recoverables), but also to intermediaries and customers. Depending on the fact whether the exposure concerns a smaller number of

³⁵ Applied on the part of the bonds portfolio to which the spread shock, defined in the Solvency II standard formula applies.

³⁶ For more details on the actual calculation of the solvency ratio as used for official reporting purposes, we refer to the chapter on Capital Management.

larger counterparties with limited diversification among them (like banks and reinsurers) or a large number of smaller counterparties with a high degree of diversification, these risks are respectively labelled as 'type 1' or 'type 2'.

The risk exposure from both 'type 1' and 'type 2' decreased since YE2023, resulting in an over-all decrease of the capital requirement for counterparty default risk by 27.8 % (i.e. from € 98.1 million at YE2023 to € 70.9 million at YE2024). In 'type1', the decrease mainly reflected the company's decreased cash holdings after the settlement of the initial premium for the 2024 classic life reinsurance transaction which took place at the beginning of 2024. In 'type 2', the decrease is proportionally smaller than in 'type 1', and is related to a decrease of recoverables from intermediaries and policyholders.

C.3.2. Risk concentration

Regarding the 'type 1' exposure, the company's balances of cash accounts are usually split among its main bank relations and fluctuate throughout the year. At YE2024, the share of the bank counterparty with the highest balance sheet exposure represented 6.1 % of the total counterparty exposure, which is substantially less than at YE2023. At the same time, the number of reinsurance counterparties is high, and the exposed amounts by reinsurer remain limited, which has a positive effect on the diversification of the risk at the level of the 'type 1' exposure. The only exception to this rule concerns the the 2024 classic life reinsurance transaction, where a single counterparty covers the whole reinsurance recoverable, however with adequate risk mitigating measures (see below).

Finally, at the level of the 'type 2' exposure, the company's loans portfolio and its insurance recoverables and receivables are also highly diversified, so the company considers its total risk concentration regarding counterparty default risk as acceptable.

C.3.3. Risk management and risk mitigation

When Baloise Belgium NV starts a collaboration with large parties like banks or reinsurers, it always carefully checks their creditworthiness.

For reinsurers, in general, transactions will only be engaged in with candidates that have at least an A rating (with BBB allowed in exceptional cases and under certain conditions). Selection of reliable partners is further supported by the use of a list of safe ('admitted') reinsurers, provided by Baloise Group, while a frequently updated watch list is available mentioning reinsurers with payment problems.

Insofar as possible, Baloise Belgium NV spreads its reinsurance among a sufficient number of economically independent counterparties which guarantees a substantial diversification, so that the concentration risk is adequately managed.

Finally, collateral under the form of reinsurance deposits or custodied assets mitigates the exposure to this risk for a substantial part of the reinsurance recoverables. This is in particular the case for the 2024 classic life reinsurance transaction, where the agreement clearly specifies the volume, type and quality of assets to be custodied.

Evidently, the prudent approach followed when selecting reinsurance partners also applies when selecting bank counterparties for cash deposits or derivatives contracts.

The large majority of the aforementioned highly diversified 'type 2' receivables relates to intermediaries and customers. Management of the exposure to intermediaries is realized by Baloise Belgium NV's criteria to start and continue the collaboration with brokers, and further by procedures of close monitoring of timely settlement of receivables and balances of broker accounts. The exposure to clients is essentially managed by an active follow up system for unpaid premiums.

For retail mortgage loans (including the Dutch mortgages portfolio) strict criteria regarding the 'loan to value' ratio apply.

All the aforementioned policies, practices and mitigating actions make that the counterparty default risk only represents a limited fraction of Baloise Belgium NV's overall risk exposure.

C.3.4. Risk sensitivity

When using the Solvency II standard formula quantification of the counterparty default risk as an indicator for the company's sensitivity to this risk, we conclude that its impact on the company's own funds is such that the compliance to regulatory capital requirements further holds.

C.4. Liquidity risk

C.4.1. Risk exposure and risk management

Liquidity risk is the risk that, especially under the circumstances where sudden large cash outflows occur, the company is unable to liquidate the necessary investments and other assets, or to find alternative refinancing in order to settle its financial obligations without incurring significant financial losses.

An important indicator for the assessment of the liquidity risk is provided by the volume of liquid assets (bonds and equities that are traded in an active market, together with cash holdings), as a percentage of the total asset position. On this basis, at 31/12/2024, 71.7 % of the total assets volume is considered as liquid, which indicates that the company is substantially protected against this risk. Other indicators used for

monitoring the company's exposure to liquidity risk compare the expected cash outflows over the next 12 months to resp. the liquid assets at valuation date and the expected cash inflows over the next 12 months, augmented by the cash holdings at valuation date. At 31/12/2024, all indicators fell within the company's target bandwidths.

Sudden surges of the lapse rates in large parts of the life activity are very unlikely, given the application of substantial fiscal and contractual penalties in case of early surrender. Moreover, the realisation of the company's sustainable growth strategy in a going concern setting is strongly supporting the generation of large net annual cash inflows, and hence additionally protecting the company against the liquidity risk.

Exposure to the liquidity risk in the longer term is also assessed on a quarterly basis by use of cash flow projections, which allow to project cash balances by future one year periods over a 40 year horizon. The performed projections revealed no issues regarding the availability of sufficient future liquidity.

In addition, Baloise Belgium NV has an active cash management, based on a detailed liquidity planning of which the objective is exactly to assure that cash will be available in function of the company's short term liquidity needs.

Based on the aforementioned features of Baloise Belgium NV's assets and liabilities, and its active management and follow up of its liquidity position, the company considers its exposure to the liquidity risk as very low.

The expected profits included in future premiums amount in total to € 158.2 M.

C.4.2. Risk concentration

Given the high degree of diversification in the company's portfolio of liquid assets (in terms of asset types, counterparties and maturity dates) and in its client portfolio (in terms of legal status, tax regime, age structure and product type), the company considers the concentration of its liquidity risk as immaterial.

C.4.3. Risk mitigation

Considering the adequacy of the aforementioned management of the liquidity risk, which is further enhanced by access to credit lines and repurchase agreements, Baloise Belgium NV does currently not intend to take any additional risk mitigating measures.

C.4.4. Risk sensitivity and stress testing

The company's exposure to liquidity risk is subject to a regular (i.e. quarterly) stress testing procedure. The stress tests measure the impact of adverse circumstances like mass lapses, a severe decrease in premium income or in market liquidity, an extreme claim event or an increasing yield environment on the aforementioned liquidity indicators. Throughout the year, all obtained indicators remained within the target bandwidths, apart from a few limited deviations which were still accepted given the ample availability of liquid assets to restore the targeted levels.

Furthermore, the company's regular long term cash projections are not only performed under a central scenario but also under a series of alternative scenarios, which measure the sensitivity to several modifications of the yield curve. The projections did not reveal any circumstances which would require further action.

C.5. Operational risk

C.5.1. Risk exposure

Operational risk stems directly or indirectly from the business operations of a company and includes losses arising from inadequate or failed internal processes, staff members or systems, or from external events.

We consider the exposure to the operational risk as an inherent element of the business activity. However, the early recognition, assessment and management of potential sources of operational risk are covered by the company's internal control system and its periodic risk assessment process, so that the residual exposure to the operational risk remains limited and acceptable.

The COSO-based internal control system provides a systematic risk coverage, based on a detailed and recurring company-wide risk analysis at the level of the elementary business processes, the definition of appropriate measures and controls and a recurrent assessment of the effectiveness and the observation of these control measures³⁷.

The periodic risk assessments, which follow the structure of the Baloise Risk Map, also cover the main operational risk clusters like IT risks, HR risks, process risks, legal and compliance risks and risks related to risk reporting itself. Here also, the Baloise Risk Map is modified whenever material changes in the risk landscape occur.

³⁷ For more details on the principles and methodology of the Internal Control System and the control assessment process, see the section on the company's Internal Control System in the chapter on the governance system.

The combined implementation of both approaches, viz. internal control system and risk assessments of stand-alone risks based on the Baloise Risk Map, guarantees that the operational risks are under control. In the most recently reported annual risk assessment, none of the stand-alone operational risks was labelled as a 'critical' risk, but a number of risks related to IT and outsourcing were considered 'high' risks.

C.5.2. Risk concentration

The various operational risks relate to a wide range of mostly mutually independent operational areas, so we consider the risk of concentration with respect to operational risks as limited.

C.5.3. Risk mitigation

Mitigation of operational risks is an inherent component of the aforementioned processes of risk management and internal control, in that these processes comprise both the definition and the assessment of the effectiveness of risk mitigating measures.

Risk mitigation measures can be either one-off measures (e.g. organisational adjustments) or recurrent controls, where the latter range from the general entity level (covered by entity level controls), over the general IT control level to the individual operational processes (covered by process controls). Furthermore, the company has adequate processes in place for periodic reporting on the status and effectiveness of the Internal Control System.

In all departments of the company, operational risk partners have been appointed. They are the first contacts of the risk management function and have an important role to play in raising awareness of the entities' exposure to operational risk. Another important task of the operational risk partners is to notify the risk management function of the operational incidents that occurred in their departments and the measures that were taken to deal with them to reduce the immediate impact, and/or the impact and likelihood of future incidents. The risk management function collects these incidents in a central register, periodically makes an analysis of them and reports the results to the ALCO-RICO and Executive Committee.

C.5.4. Risk sensitivity

The annual risk assessments of the stand-alone operational risks according to the Baloise Risk Map include estimations of the potential impact in terms of financial loss, reputational damage, regulatory consequences and the need for organisational adaptations. In this way, the results of the risk assessments provide indications for the company's sensitivity to specific aspects of the operational risk. Even if an occurrence of several of these stand-alone operational risks is assumed in the same year, compliance with the solvency capital requirements is always maintained.

While the aforementioned approach for the assessment and management of operational risks largely focuses on a wide range of sub-risks, the company also uses the regulatory capital requirement for operational risk of the standard formula as an alternative, global indicator for its overall exposure to this risk. So, this capital requirement can again be interpreted as an indication for risk sensitivity, and the obtained loss amounts again represent only a limited fraction of the company's own funds.

Finally, the company has also developed qualitative plans for the remediation of situations according to stress test scenarios including the failure of key processes and systems and unavailability of key functions, the occurrence of a severe external event and a cyberattack.

C.6. Other material risks

The Baloise Risk Map also contains two categories of risks which have not yet been dealt with in the previous paragraphs: the business environment risks and the leadership and information risks.

The company also looks at its risk position from two additional perspectives, namely the strategic risk view and the view of the emerging risks, in order to identify other, potentially material risks. Finally, we also look at risks potentially related to off-balance sheet transactions.

Business environment risks, and leadership and information risks

Business environment risks and leadership and information risks arise directly or indirectly from the business environment and the strategic activities of the company, respectively. Both categories are included in the yearly risk assessment exercise based on the Baloise Risk Map.

In the assessment exercise in the first quarter of 2024, the risk regarding sustainability in Baloise Belgium NV's strategy was the highest ranked risk in the category of the 'leadership and information risks': it was rated as a 'medium level' risk. As for the category of 'business environment' risks, these were all rated as 'medium' or 'low' risks.

Emerging risks

Emerging risks are new or foreseeable risks, which cannot easily be quantified yet, for example due to the lack of historical data, but which might have a major financial impact.

Baloise Belgium NV performs the identification and analysis of emerging risks on an annual basis with a time horizon of 20 years in mind. The assessment is made in terms of potential impact and expected time until materialisation.

In 2024, the company identified one emerging risk with a potentially very high impact: viz. a long-term return to the low interest rate environment. For six risks, the potential impact was rated 'high': energy and

electricity shortage, risks related to future workforce, AI and robotics, shifts in insurance distribution models, decentralized finance (blockchain), infectious diseases and mobility.

For each risk, it was also estimated when it could have effect on Baloise Belgium NV. Materialisation within 5 years was not expected with any of the emerging risks. For five risks, materialisation was expected after 5 years, and for the other eight risks, materialisation was expected after 7 or 10 years.

Strategic risks

The relevant time horizon for the assessment of strategic risks is equal to the business planning period.

The most recent assessment ranked information and cyberrisks at the top. Furthermore, eleven other risks were considered to be 'high risks'. Within this group, the following four risks were given the highest rating and completed the top 5 of strategic risks: IT service continuity and disaster recovery capabilities, political and macroeconomic developments, IT supply chain risk, and inflation-related profitability pressure and lapse.

Sustainability risks

In general, sustainability is considered along the dimensions environmental³⁸, social and governance (ESG). Risks related to sustainability are integrated into existing risk management processes and frameworks. Whereas sustainability in Baloise Belgium NV's strategy forms a separate risk type within the risk category "Leadership and Information Risks", operative sustainability risks are integrated within the traditional risk categories of the risk map such as market, underwriting or reputational risks. Integrating risks with a sustainability aspect into existing risk processes (e.g. into the ORSA process) assures that they are assessed regularly from different perspectives and that measures are in place to manage and mitigate them successfully.

In addition, more specifically for climate change risk, the company produces materiality assessments based on sensitivity analyses, and it is making the necessary developments to further integrate this risk into its quantitative models.

Risks related to off balance sheet positions

Baloise Belgium NV's security lending activity is hedged by the use of collateral (essentially bonds), which covers the lent securities. To minimize the credit risk, a regular assessment of the values of the covering securities takes place.

³⁸ Including climate change.

In addition, contracts also include a parental guarantee from the custodian, meaning that the custodian is responsible for returning the securities back to Baloise Belgium NV, in case the borrower shouldn't meet his obligation

C.7. Other relevant information

There is no additional relevant information to be mentioned.

D. Valuation for solvency purposes

When valuating its assets and liabilities for solvency purposes under Solvency II, Baloise Belgium NV aligns its valuation principles with the regulatory requirements as formulated in the Law of the 13th of March 2016 on the regulation and supervision of insurance and reinsurance undertakings, and in the related regulation. This means that valuations are based on fair value. In practice, the company uses either observable market values or values based on generally accepted methods and models.

In its financial statements, on the other hand, Baloise Belgium NV values its assets and liabilities according to local (Belgian) general accounting principles (or in short 'BGAAP'). In the following sections, Baloise Belgium NV further documents the valuation principles it applies for solvency purposes, and it highlights relevant differences with the BGAAP based valuation as used in its financial statements.

First this will be done for the assets, then for the technical provisions, and finally for the other liabilities³⁹.

D.1. Assets

D.1.1. Basis, methods and assumptions for the valuation

General principles for the valuation of assets for solvency purposes.

Asset valuations are set at, or based on market price ('marking to market'), insofar as the corresponding active market requirements (for instance enough transactions in terms of frequency and volume have to take place between willing, knowledgeable parties) are met.

If no relevant market prices are available, generally accepted models of mathematical finance will be used if available.

In subordinated order, other valuation principles which comply with the regulatory requirements will be considered.

In some cases, for instance for cash and for insurance and intermediaries receivables, the valuation will be based on the nominal amount outstanding⁴⁰, which, in general also corresponds to the value under the IFRS standards.

³⁹ There are no substantial changes in the valuation principles compared to the previous period.

⁴⁰ Corrected, if applicable, for doubtful debt on a case by case basis.

There have been no material changes in the principles for recognition, valuation and classification of assets for solvency purposes since the previous reporting period.

Application of the valuation principles by material asset class.

For the company's complete bonds portfolio, quoted market prices from active markets were readily available for the valuation at 31/12/2024.

For the valuation of investment property, the discounted cash flow approach is complemented by comparisons with market data from similar properties.

Participations in property corporations are valued by correcting the BGAAP equity for latencies on property and loans and for deferred taxes, while for other participations the market value is in general estimated by use of the IFRS equity⁴¹.

Loans and mortgages, granted by the company, are valued by discounting the projected cash flows with the Solvency II discount curve, including a correction (as a spread term) for credit risk.

For investments in collective investment undertakings, valuation coincides with the most recent net asset value of the shares available at valuation date. This also holds for the shares held for unit linked insurance.

Valuation of the reinsurance recoverables is coherent with the valuation of the underlying (direct) liabilities. It further includes a correction for the expected losses, due to the default of the reinsurer.

(Net) deferred tax assets are calculated as the difference, at valuation date, between deferred recoverables and deferred taxes, resulting from negative and positive temporary differences between the actual value for solvency purposes and that for tax purposes. The amount of deferred recoverables is only taken into account for so far as its recoverability is probable.

Results of the valuation.

Detailed results of the valuation for regulatory solvency purposes can be found in the table S.02.01.02 in the annexes. The graph below shows the distribution of these values over the most important asset classes.

⁴¹ For the Euromex participation, the Solvency II own funds are used.

Comparison to the previous reporting period.

The table below shows the values of the different asset classes (as valuated for solvency purposes) at the end of the previous and the current reporting period.

Balance Sheet: Assets under Solvency II Valuation

	2023	2024	Difference
In '000 EUR			
Deferred tax assets	104,623.5	56,743.0	-47,880.5
Property (other than for own use)	246,219.8	244,698.8	-1,521.0
Holdings in related undertakings, including participations	372,714.0	372,221.7	-492.3
Equity	18,028.6	15,130.3	-2,898.3
Government Bonds	4,492,482.3	4,115,287.8	-377,194.5
Corporate Bonds	3,239,332.1	2,845,077.1	-394,255.0
Collective Investments Undertakings	965,981.8	1,187,096.8	221,115.0
Assets held for index-linked and unit-linked contracts	763,180.6	865,092.8	101,912.2
Loans & mortgages	872,354.3	890,878.7	18,524.4
Reinsurance recoverables	523,331.7	1,390,845.0	867,513.3
Insurance and intermediaries receivables	308,185.5	290,984.1	-17,201.5
Cash and cash equivalents	526,131.1	121,749.7	-404,381.4
Other	97,775.9	115,849.6	18,073.7
Total assets	12,530,341.2	12,511,655.5	-18,685.8

While the total asset value slightly decreased (by 0.1 %) over the year, we observe some material changes in the underlying asset classes.

The largest of these changes all relate to the 2024 classic life reinsurance transaction. In particular, a large part of cash amount available at YE2023 was used for the settlement of the initial reinsurance premium.

This was also the case for cash released from bonds that reached maturity before the settlement date of the transaction⁴². Evidently, the payment of the initial reinsurance premium explains the strong increase for the 'Reinsurance recoverables'.

Further, some additional investments were made in Collective Investment Undertakings; these also included reinvestments from bonds at maturity.

The investments in assets held for index-linked and unit-linked contracts benefited from the strong performance of the equities markets in 2024 and also increased thanks to the net inflows into the underlying funds.

The net impact of changes in risk free rates and spreads on the valuation of fixed income instruments remained limited on a 'year to year' basis.

D.1.2. Reconciliation to financial reporting

Comparison of valuation results for solvency purposes with valuations for financial reporting.

In the table below, we compare the aforementioned valuation of the assets for solvency purposes at 31/12/2024 with the valuation according to the local BGAAP principles as used for financial reporting.

⁴² Hence most bonds, expiring before the settlement date of the transaction, were not reinvested but held in cash until settlement, which also explains the decrease of the bonds volumes.

Balance Sheet: Assets under Local GAAP and Solvency II Valuation

	Solvency II	Local GAAP	Difference
In '000 EUR			
Deferred tax assets	56,743.0	-	56,743.0
Property (other than for own use)	244,698.8	171,167.0	73,531.9
Holdings in related undertakings, including participations	372,221.7	214,927.7	157,294.0
Equity	15,130.3	14,296.9	833.4
Government Bonds	4,115,287.8	4,729,765.7	-614,477.8
Corporate Bonds	2,845,077.1	3,010,985.9	-165,908.8
Collective Investments Undertakings	1,187,096.8	1,317,111.8	-130,015.0
Assets held for index-linked and unit-linked contracts	865,092.8	865,092.8	-
Loans & mortgages	890,878.7	915,065.6	-24,186.9
Reinsurance recoverables	1,390,845.0	1,460,263.3	-69,418.3
Insurance and intermediaries receivables	290,984.1	359,455.3	-68,471.3
Cash and cash equivalents	121,749.7	121,749.7	-
Other	115,849.6	126,415.1	-10,565.5
Total assets	12,511,655.5	13,306,296.9	-794,641.5

Significant differences between asset valuation for solvency purposes and for financial reporting.

The most significant differences between both valuation approaches are found with the bonds portfolio. Under BGAAP, valuation is based on the 'actuarial return' method, which corresponds to the discounting of future cash flows at the actuarial return rate as determined at acquisition date of the bond, with the application of impairments limited to substantially adverse evolutions. At YE2024, the difference between the Solvency II and BGAAP valuations of the total bonds portfolio remained practically unchanged in comparison to YE2023, which confirms the limited changes of market yields on a year to year basis.

We see a positive difference between valuation for solvency purposes and BGAAP for Baloise Belgium NV's holdings in related undertakings, including participations, which are mostly invested in property. For these holdings in related undertakings, BGAAP valuation is based on the purchase price (with the application of impairments and revaluations restricted to specific circumstances) while valuation for solvency purposes in particular reflects the evolution of the market value of the underlying assets. The difference between both valuation frameworks mainly reflects the increase in market value of the underlying property over the past years.

For (directly owned) property, equities and collective investment undertakings, BGAAP valuation is also based on the historic cost⁴³, which means that the differences with valuations for solvency purposes again reflect accumulated fluctuations in market value resp. net asset value.

⁴³ Albeit with the application of amortisations for property.

For loans and mortgages, BGAAP valuations coincide in principle with the nominal amount outstanding. The valuations under BGAAP are not impacted by changes of the interest rate curve, whereas under solvency valuation they are. Just like at YE2023, the Solvency II valuation of the loans and mortgages portfolio is lower than that, according to BGAAP.

Under BGAAP, valuation of reinsurance recoverables is derived from the BGAAP valuation of the corresponding direct liabilities. The excess of the BGAAP valuation over the valuation for solvency purposes at the reinsurance level mainly results from the higher direct non-life technical provisions under BGAAP. However, this effect is partially offset by the lower valuation of the reinsurance recoverables under BGAAP for the portfolio under the 2024 classic life reinsurance transaction.

Under BGAAP, intangible assets including goodwill are recognized⁴⁴ (which is not the case under the valuation for solvency purposes) while on the contrary, the notion of deferred tax assets is not considered under BGAAP.

Finally, the BGAAP value of 'insurance and intermediaries receivables' item additionally contains a contribution for the 'estimated recourse'. Under solvency valuation, this 'estimated recourse' is directly taken into account in the technical provisions.

D.2. Technical provisions

D.2.1. Basis, methods and assumptions for the valuation

Technical provisions represent by far the largest part of the company's liabilities.

In general there are no market prices available for the valuation of technical provisions. Hence, the valuation methods of these technical provisions for solvency purposes, (which are composed of a best estimate part and a risk margin) have to take into account appropriate market parameters.

The valuations are made by using actuarial models and methods of mathematical finance which produce stochastic and deterministic cash flow projections, that are then, in turn, discounted in order to obtain the best estimates. These cash flow projections are based on comprehensive sets of realistic parameters and assumptions, which, in general, comprise future premiums⁴⁵, claims, expenses, commissions, profit sharing and rebates, etc. In the case of the life activity, elements like future mortality, lapses, financial scenarios (and the impact thereof on lapses and profit sharing) also impact the timing and size of the projected cash flows. In the non-life activity, claims and cost ratios, the development patterns for claims settlement and

⁴⁴ And represented as a part of the 'Other' item in the table above

⁴⁵ As far as within the applicable contract boundaries.

the allocation of loss adjustment expenses are typically the important drivers underlying the cash flow projections.

For discounting the cash flows, the company applies the official EIOPA risk free yield curves, to which it adds the volatility adjustment as published by EIOPA. The volatility adjustment allows the company to use liabilities' valuations which reflect an improved coherence with asset valuations. This eliminates peculiar fluctuations in a context of long term assets and liabilities. The volatility adjustment is based on the assumption that the company will often be able to avoid early realisation of losses on assets thanks to the long term nature of the liabilities they cover. Its implementation is not subject to any prior approval by the supervisory authority. We remind that the use of the volatility adjustment precludes the application of the 'matching adjustment'⁴⁶ on the risk free yield curve.

Risk margins are calculated using a 'cost of capital' approach. Under this approach, the risk margin represents the cost of providing an amount of eligible own funds equal to 100 % of the regulatory required solvency capital for the existing liabilities over their remaining lifetime⁴⁷. Since 2023, the company calculates the risk margin for its life activity by use of an enhanced set of projected risk drivers. No diversification effects are taken into account between the life and the non-life activity when calculating the risk margins.

Although the regulation offers insurance companies possibilities to apply for a gradual transition from the previously applicable ('Solvency I') solvency framework to the current Solvency II framework over a period of 16 years⁴⁸, Baloise Belgium NV has chosen not to make use of these transitional measures.

D.2.2. Results of the valuation for solvency purposes

Results at 31/12/2024.

We refer to the table S.02.01.02 in the annex for an overview of the results of the valuation of the technical provisions. In addition, the tables S.12.01.02 and S.17.01.02 provide the amounts of the technical provisions by lines of business respectively for 'Life and Health SLT' and for 'Non-life' (including non-SLT Health).

The following graph shows the distribution of the technical provisions over the main product groups.

⁴⁶ Which is another so called 'long term guarantee measure' with similar purpose, available within the Solvency II framework as an alternative for the 'volatility adjustment'.

⁴⁷ From the point of view of a 'reference undertaking', making abstraction of the capital cost for hedgeable market risks.

⁴⁸ Either at the level of the applicable interest rates for discounting, or by application of an annually decreasing deduction on the amount of technical provisions.

Given the random nature of several factors impacting the company's insurance liabilities, a level of uncertainty has to be taken into account when considering the model based valuation of these liabilities. In the life business, fluctuations of market interest rates, lapse rates and inflation can be considered as significant sources of uncertainty. In the non-life business, the actual number and size of claims, the occurrence of catastrophes and adverse developments of existing claims settlements can lead to significant deviations from the estimates underlying the valuation of the gross liabilities. However, reinsurance of liabilities mitigates significantly the impact of volatile provisions on the net own funds position of the company.

While for the base case calculations underlying the officially reported technical provisions, the company has used the volatility adjustment (or 'VA'), it has also performed a calculation without VA. Under the latter assumption, the projected cash flows are discounted with lower discount rates, so that the value of the technical provisions increases from € 10,295.8 million (with VA) to € 10,454.6 million (without VA) while the amount eligible to cover the SCR decreases from € 1,660.1 million to € 1,558.2 million. The amount eligible to cover the MCR decreases from € 1,308.5 million to € 1,174.4 million. The SCR itself increases from € 934.4 million to € 954.5 million and the MCR increases from € 420.5 million to € 429.5 million. We remind that such a complete cancellation of the VA is hypothetical and that under decreasing VA, at least a partial compensation by increasing asset values could be expected. See also the table S.22.01.21 in the annexes for the corresponding figures.

Comparison to the previous reporting period.

The table below shows the evolution of the valuation of the technical provisions (gross of reinsurance⁴⁹) since the previous reporting period.

⁴⁹ The value of the amounts recoverable from reinsurers can be found in the section on the valuation of the assets. The company does not use any special purpose vehicles.

Balance Sheet: Technical provisions under Solvency II Valuation

	2023	2024	Difference
In '000 EUR			
Technical provisions - non-life (excluding health)	1,823,865.3	1,734,460.6	-89,404.8
Technical provisions - health (similar to non-life)	212,621.2	212,138.0	-483.2
Technical provisions - health (similar to life)	473,292.2	464,456.3	-8,835.9
Technical provisions - life (excluding health and index-linked and unit-linked)	7,106,135.0	7,090,563.5	-15,571.5
Technical provisions - index-linked and unit-linked	713,363.1	794,219.2	80,856.1
Total technical provisions	10,329,276.8	10,295,837.6	-33,439.2

Changes in interest rate curves, as used for discounting projected cash flows, are usually important factors in the explanation of changes in the company's technical provisions, and this in particular for the life and health similar to life activities, where the long term nature of the liabilities results in high sensitivities to such changes. When comparing discount rates in force at 31/12/2024 (more specifically the risk free rates increased by the VA) with those at 31/12/2023, we notice a decrease⁵⁰, which remains however limited for the largest part of the yield curve. See the graph below.

Where necessary the various assumptions, model parameters and specifications underlying the projections of cash flows have been reviewed and updated to stay in line with the company's actual

⁵⁰ The average decrease over the first 30 years amounts to 17 bps.

expectations, for instance with respect to claims amounts, calibration and allocation of expenses, development patterns, mortality rates, lapse rates etc.

Whereas the aforementioned decrease of the discount rates caused a limited increase of the technical provisions, this increase has been offset by other effects like the recognition of improving trends underlying the model assumptions and parameters, or the net cash inflow.

D.2.3. Reconciliation to financial reporting

In the table below, we provide a summary view of the valuation of the technical provisions at 31/12/2024 (again gross of reinsurance), both under valuation for solvency purposes and according to BGAAP.

Balance Sheet: Technical provisions under Local GAAP and Solvency II Valuation

	Solvency II	Local GAAP	Difference
In '000 EUR			
Technical provisions - non-life (excluding health)	1,734,460.6	2,509,693.5	-775,232.9
Technical provisions - health (similar to non-life)	212,138.0	291,394.4	-79,256.4
Technical provisions - health (similar to life)	464,456.3	489,480.0	-25,023.7
Technical provisions - life (excluding health and index-linked and unit-linked)	7,090,563.5	7,487,495.1	-396,931.5
Technical provisions - index-linked and unit-linked	794,219.2	865,092.8	-70,873.7
Total technical provisions	10,295,837.6	11,643,155.8	-1,347,318.2

The largest difference in valuation is seen between both frameworks for the non-life business (excluding health). There, (and also for health similar to non-life), the claims provision part of the BGAAP technical provisions starts in general from a prudent case by case estimation of the total expected claims amount, without application of any discounting effect. For certain lines of business, IBNR/IBNER provisions are added. For the motor vehicle liability line of business, the calculation is based on actuarial extrapolations of aggregated past claims developments. For the BGAAP provision for unearned premiums, a 'pro rata' reserving approach is applied. Under Solvency II, on the other hand, the best estimate is equal to the expected discounted value of all relevant cash flows, based on a 50 % confidence level. In 2024, the excess of BGAAP provisions over SII provisions in non-life increased, a.o. as a result of improved cash flow patterns and the recognition of improving trends underlying model parameters.

There is also a significant difference between the valuations for the life business (excluding unit-linked products). This is essentially explained by structural differences in the valuation methodology and the underlying parameters⁵¹, especially the discount rates. While under valuation for solvency purposes, all

⁵¹ The comparison between valuation for solvency purposes and BGAAP is also biased by the fact that under BGAAP, the technical provisions also include the provision for pension benefits for the company's own staff whereas under SII, this provision is reported separately as the 'Pension benefit obligation'; see section D.3 below.

relevant expected cash flows are projected and then discounted within a market consistent framework, BGAAP calculations of the technical provisions are based on tariff parameters like the technical interest rate (as for discounting), and make abstraction of realistic expectations for expenses, commissions, mortality rates, future profit sharing and market consistent discounting factors. BGAAP reserves, on the other hand, comprise a separate correction for unfavourable evolutions of the market interest rate⁵². Given the decrease of the SII discount rates in 2024, the excess of the life BGAAP provisions over the SII provisions decreased over that period.

We also remind that under BGAAP, there is no explicit equivalent of the risk margin.

Over-all the excess of the combined life and non-life BGAAP provisions over SII provisions still increased by € 110.5 million between YE2023 and YE2024.

D.3. Other liabilities

In addition to the aforementioned technical provisions, the liabilities side of the company's balance sheet for solvency purposes contains a number of 'other liabilities'.

D.3.1. Basis, methods and assumptions for the valuation

General principles for the valuation of other liabilities for solvency purposes.

Given the nature of the majority of the items belonging to the 'other liabilities' group, relevant corresponding market prices are often unavailable. For several of these items, especially for various types of payables, valuation for solvency purposes will correspond to the IFRS carrying value which is then based on the nominal amount outstanding or payable. Settlement terms for such payables are usually short and amounts fixed, so that the risk for deviations from the thus obtained valuation is limited.

For a few specific liability items, more elaborate valuation techniques have to be implemented in order the align valuation with Solvency II's fair value approach.

Application of the valuation principles by material 'other liabilities' class.

Pension Benefit Obligations relates almost completely to the company's obligations as an employer, resulting from pension benefit plans for own staff members. The valuation for solvency purposes is based on the IAS19 approach. It implies cash flow projections which reflect realistic assumptions for premium

⁵² The so called 'flashing light reserves'.

rates, profit sharing, turnover rates, salary evolutions etc. Essentially, the liability is valued by calculating the present value of the expected future cash flows using a market relevant discount rate.

For subordinated liabilities, valuation is based on discounting of cash flows.

Other liability items with significant amounts on the balance sheet are 'Insurance and intermediaries payables' and 'Deposits from reinsurers'. For both, the valuation is based on the nominal amounts outstanding.

Results of the valuation.

Detailed results of the valuation for solvency purposes can be found in the table S.02.01.02 in the annexes. The graph below shows which items provide significant contributions to the total valuation for 'other liabilities'.

The table below shows the changes in the composition of the company's 'other liabilities' over 2024.

Balance Sheet: Other liabilities under Solvency II Valuation

	2023	2024	Difference
In '000 EUR			
Pension benefit obligations	112,271.9	109,454.6	-2,817.3
Deposits from reinsurers	140,123.1	134,335.3	-5,787.9
Insurance & intermediaries payables	196,075.7	181,474.3	-14,601.4
Subordinated liabilities	366,547.7	378,917.6	12,369.9
Other	101,445.7	130,455.8	29,010.0
Total other liabilities	916,464.1	934,637.6	18,173.5

The observed changes over 2024 remain limited. The increase of the 'Other' item stems from higher reinsurance and 'trade, not insurance' payables.

D.3.2. Reconciliation to financial reporting

Comparison of valuation results with financial reporting.

The table below shows the differences in valuation between the valuation for solvency purposes and BGAAP for the most important 'other liabilities' items.

Balance Sheet: Other liabilities under Local GAAP and Solvency II Valuation

	Solvency II	LocalGAAP	Difference
In '000 EUR			
Pension benefit obligations	109,454.6	4.0	109,450.6
Deposits from reinsurers	134,335.3	134,335.3	-
Insurance & intermediaries payables	181,474.3	176,677.5	4,796.8
Subordinated liabilities	378,917.6	380,000.0	-1,082.4
Other	130,455.8	131,888.8	-1,433.0
Total other liabilities	934,637.6	822,905.5	111,732.1

We find the largest difference in value for the pension benefit obligations. This is caused by the fact that under BGAAP, the IAS19 principles do not apply, and that the valuation and reporting of the liabilities resulting from pension plans for staff members simply follow those of the company's other life insurance contracts. So under BGAAP, these liabilities are limited in value to the normal contract reserves and are completely reported as a part of the life technical provisions.

The difference in value for the Subordinated liabilities results from the use of the nominal value of the liabilities for valuation under BGAAP, whereas the valuation for solvency purposes is based on the discounting of cash flows.

Further, there are no significant differences between the two valuation approaches at YE2024.

D.4. Alternative methods for valuation

This is not applicable for Baloise Belgium NV.

D.5. Other relevant information

There is no additional relevant information to be mentioned.

E. Capital management

E.1. Own funds

E.1.1. Capital management: objectives, policy and processes

The overarching conditions regarding the company's capital position are set on the one hand by regulatory requirements and on the other by internal capital and risk management guidelines. Together, these will allow to assure both the protection of the policyholder, and the risk-oriented management of the business activity.

The objective of Baloise Belgium NV, as specified in its 'Risk Strategy, Risk Appetite and Capital Management policy', is the long-term and sustained securing of sufficient capitalisation, the fulfillment of all supervisory requirements, and the safeguarding of the interests of its stakeholders. Baloise Belgium NV's capital management is fully integrated in the risk-based business strategy and ensures an efficient use of capital at all times, while fulfilling the aforementioned boundary conditions.

Baloise Belgium NV uses the Solvency II standard formula not only to derive its regulatory capital requirement but also as a reference for the specification of its risk appetite and capital needs, according to its internal guidelines. In addition, the capital and solvency needs are also quantified with reference to the 'Swiss Solvency Test'. The company's dividend decisions and capital planning are coordinated in view of the current and future compliance with these criteria. The observation of these requirements also takes a central place in the company's business planning activity, which provides each year an update of the business plan, covering a horizon of 5 years.

Baloise Belgium NV has implemented all necessary reporting procedures, decision processes and controls to guarantee the implementation of the aforementioned requirements. The processes comprise the regular⁵³ comprehensive calculations and assessments of the company's risk, capital and solvency position. These are complemented by intermediate estimates on a monthly basis, provided by Baloise Group. For cases where target solvency ratios might not be reached, an escalation procedure has been established which includes the identification of appropriate reactive management actions. And the company's governance system guarantees that, whenever a management decision could have a potential impact on the company's capital position, this impact will be assessed and documented before the final decision is taken.

⁵³ i.e. quarterly for Solvency II, yearly for Swiss Solvency Test.

In 2024, there have been no changes in the principles underlying the company's capital management.

E.1.2. Own funds analysis

Amount of own funds.

At 31/12/2024, the amount of available own funds to meet the SCR (€ 1,660.1 million) results from an excess of assets over liabilities of € 1,281.2 million and a subordinated liability valued at € 378.9 million. All of these available own funds are of the basic own funds type⁵⁴ and are also eligible to cover the SCR.

The large majority (€ 1,224.4 million, or 73.8 %) of these eligible own funds belongs to the unrestricted tier 1 class, which represents the highest possible quality level of own funds. The main parts of the 'unrestricted Tier 1' own funds correspond to the reconciliation reserve and the ordinary share capital. For these items, there are no terms or conditions which reduce their availability.

The tier 2 part of the eligible own funds corresponds to the company's 'subordinated liabilities' position of € 378.9 million (i.e. 22.8 % of the total). Just like at YE2023, these subordinated liabilities do not exceed the 50 % of the company's Solvency Capital Requirement, and they fulfill all criteria to qualify as eligible own funds.

The recognized net deferred tax assets ('DTA') at YE2024 do not exceed the 15 % of the SCR and the sum of the DTA and the tier 2 capital does not exceed 50 % of the SCR. Hence these net deferred tax assets are completely eligible as Tier 3 capital. They represent € 56.7 million or 3.4 % of the total eligible own funds.

Changes in own funds over the year.

The total amount of eligible own funds (to cover the SCR) increased from € 1,651.1 million at 31/12/2023 to € 1,660.1 million at 31/12/2024, thus increasing by 0.5 %. Below, we show a comparison of the eligible own funds at 31/12/2024, by tier, with the corresponding values at 31/12/2023.

⁵⁴ See table S.23.01.01 in the annexes.

Own funds by tier

	2023	2024	Change vs. previous year
In '000 EUR			
Tier 1 unrestricted	1,179,976.8	1,224,437.3	3.8%
Tier 1 restricted	-	-	0.0%
Tier 2	366,547.7	378,917.6	3.4%
Tier 3	104,623.5	56,743.0	-45.8%
Total eligible own funds	1,651,148.0	1,660,097.9	0.5%

The amount of unrestricted Tier 1 own funds has increased by € 44.5 million over the reporting period. This increase already takes into account the payment of an interim dividend of € 169.5 million over the reporting year 2024. The underlying creation of tier 1 own funds before dividend payment thus amounts to € 214.0 million. This includes the value creation from the regular business activities and solid investment results, but also from the immediate effect of the 2024 classic life reinsurance transaction, and the net effect of a number of model and parameter updates⁵⁵. The decrease of interest rates over the year has only had a very limited impact on the net own funds position.

The actual terms of the subordinated liabilities have resulted in a valuation of these liabilities that has increased by € 12.4 million since YE2023. The tier 2 capital increased accordingly.

The change in Tier 3 eligible own funds (i.e. a decrease of the net deferred tax assets with € 47.9 million) results from the updated valuation of taxable and deductible temporary differences in the company's balance sheet, and from the subsequent validation of the recoverability of the corresponding deferred tax assets. The decrease in deferred tax assets (and hence in tier 3 own funds) is a consequence of lower unrealized capital losses on assets and an increased excess of BGAAP technical provisions over the SII counterpart.

The reconciliation reserve increased from € 589.7 million to € 669.2 million.

In 2024, there have been no emissions or redemptions of capital instruments.

Reconciliation with equity capital under BGAAP.

As mentioned in the company's financial statements, established under the BGAAP standards, Baloise Belgium NV's total equity capital at 31/12/2024 amounts to € 772.7 million. If the surplus fund ('Fonds voor toekomstige toewijzingen') of € 67.5 million is added to this equity capital, this results in a total BGAAP equivalent of excess of assets over liabilities of € 840.2 million.

⁵⁵ Which includes a.o. the decreasing effect of the discounting over the longer development patterns on the non-life best estimates.

The difference we observe with the excess of assets over liabilities under valuation for solvency purposes (again at 31/12/2024), is equal to € 440.9 million. This amount can be exactly reconciled with the differences in valuation of assets, technical provisions and other liabilities as represented in the Solvency II balance sheet⁵⁶. We refer to the chapter 'Valuation for Solvency Purposes' for more details on the different underlying valuation principles and the contributions from the different asset and liabilities classes.

Deferred tax assets.

The company's total gross deferred tax asset as calculated at 31/12/2024 amounted to € 480.0 million. Of this amount, € 395.4 million has been recognized based on reversion of deferred tax liabilities, € 83.3 million is recognized, based on probable future taxable profits⁵⁷ and € 1.3 million is not recognized. The net deferred taxes, obtained as the difference between the gross recognized deferred tax assets and the deferred tax liabilities, then amount to € 56.7 million, which is available as a tier 3 basic own funds item. This amount is also completely eligible to cover the SCR.

E.1.3. Transitional arrangements

The company does not make use of any transitional measures mentioned in Art. 308 ter, (9) or (10) of the Directive 2009/138/EG.

E.1.4. Eligible amount of own funds to cover the SCR and MCR

Starting from the composition of the company's available own funds per tier at 31/12/2024 (73.8 % Tier 1 unrestricted, 22.8 % Tier 2 and 3.4 % Tier 3), considering the absence of ancillary own funds, and the complete eligibility of the Tier 2 and Tier 3 parts of the available own funds after application of the usual limits, we find that

⁵⁶ This difference regarding the BGAAP values is composed of the following elements:

- A lower valuation of the assets under solvency valuation (difference € 794.6 million)
- A lower valuation of the technical provisions under solvency valuation (difference € 1,347.3 million)
- A higher valuation of other liabilities under solvency valuation (difference € 111.7 million)

⁵⁷ Probable taxable future profits, not yet recognized in the actual SII balance sheet, are derived from taxable profits generated by the new business as expected according to the company's business plan. For profits from the considered business, realised beyond the business plan horizon, a progressive correction is applied in order to take into account the increasing uncertainty of the future profits.

- The total own funds, eligible to cover the SCR amount to € 1,660.1 million, as obtained by taking the sum of the whole Tier 1 (€ 1,224.4 million), Tier 2 (€ 378.9 million), and Tier 3 (€ 56.7 million) parts of available own funds.
- The total own funds, eligible to cover the MCR amount to € 1,308.5 million, as obtained by taking the sum of the whole Tier 1 amount (€ 1,224.4 million) and the Tier 2 available capital, limited to 20 % of the MCR (€ 84.1 million).

E.2. Solvency Capital Requirement and Minimum Capital Requirement

E.2.1. Solvency model

For the calculation of its regulatory solvency capital requirement, Baloise Belgium NV uses the Solvency II standard model and its standard formula and parameters. As a part of its ORSA process, the company regularly validates the appropriateness of the assumptions underlying the standard parameters for its own risk profile. This appropriateness was again confirmed in 2024.

Baloise Belgium NV has not made use of the possibility to request the authorisation to use undertaking specific parameters (USP's) instead of the parameters provided by the standard formula. Nor has it applied any simplified calculations in the use of the (sub-)modules of the standard formula.

E.2.2. Solvency Capital Requirement

Application of the standard formula has resulted in a Solvency Capital Requirement (or SCR) of € 934.4 million at 31/12/2024.

The table below shows how this amount is composed in function of the contributions from the several risk modules, and compares the situation at 31/12/2024 with that at 31/12/2023.

Solvency Capital Requirement — by use of the Standard Formula

	2023	2024	change vs. previous year
In '000 EUR			
Calculation of Basic Solvency Capital Requirement			
Market risk	538,218.0	557,254.3	3.5%
Total counterparty default risk	98,083.6	70,857.4	-27.8%
Total capital requirement for life underwriting risk	174,277.2	184,850.5	6.1%
Total health underwriting risk	174,173.8	173,265.4	-0.5%
Non-life underwriting risk	402,940.9	394,498.3	-2.1%
Diversification	-480,633.1	-474,376.7	-1.3%
Intangible asset risk	-	-	
Basic Solvency Capital Requirement	907,060.6	906,349.3	-0.1%
Calculation of Solvency Capital Requirement			
Basic Solvency Capital Requirement	907,060.6	906,349.3	-0.1%
Operational risk	92,169.4	88,805.4	-3.6%
Loss-absorbing capacity of technical provisions	-52,985.7	-60,767.6	14.7%
Loss-absorbing capacity of deferred taxes	-	-	
Total Solvency Capital Requirement	946,244.3	934,387.1	-1.3%

The graphic below visualizes the composition of the SCR at 31/12/2024 (amounts in millions of euros).

At 31/12/2024, market risk and non-life underwriting risk provide, in that order, the largest contributions to the SCR capital requirement. Market risk is essentially related to the asset position the company maintains in order to cover its technical provisions (of which the life activity group represents the largest part). Within market risk, the spread and property risks are the most important. Non-life underwriting risk reflects the

premium, reserving, catastrophe and lapse risks the company assumes in relation to its important activities in the non-life activity group as already documented in the chapter A. of this report.

In comparison to YE2023, the over-all SCR has decreased by € 11.9 million, or 1.3 %, as a net result of both increases and decreases at the level of the underlying risk modules.

The largest decrease in SCR occurs in the counterparty default risk (which decreased by € 27.2 million). The main reason for this is the reduction of the company's exposure to banks after the cash settlement of the 2024 classic life reinsurance transaction.

The decrease of the over-all SCR is further supported by a decrease of the SCR for non-life underwriting risk (by € 8.4 million). The main elements underlying this decrease are the company's far-reaching exit from the marine business under the refocusing strategy and the lower technical provisions for a number of lines of business, as explained in chapter D of this report.

The aforementioned decreases in capital requirement are partially offset by limited increases for market risk (by € 19.0 million) and for life underwriting risk (by € 10.6 million). Within the market risk module, additional equity investments led to higher SCR contributions for equity and currency risk. And within the life underwriting risk module, the increase of the lapse risk was only partially offset by the effects of the additional reinsurance underwritten in 2024.

The increase of the loss absorbing capacity of the technical provisions (by € 7.8 million) mainly reflects the company's potential to compensate the increased mass lapse shock in life by lower future sharing allocations.

The company does not use the possibility to reduce its solvency capital requirement by subtracting a loss absorbing capacity of its deferred taxes.

We refer to the chapter on 'Risk Profile' for a more detailed qualitative discussion of the several risks and the way Baloise Belgium NV manages and mitigates its exposure to these risks.

Based on the aforementioned amounts for SCR and corresponding eligible own funds, we obtain an SCR ratio of 177.7 % (€ 1,660.1 million / € 934.4 million) at 31/12/2024 vs. 174.5 % (€ 1,651.1 million / € 946.2 million) at 31/12/2023. The ratio was continuously monitored during the year. Measures of risk steering included the continuous alignment of durations of assets and liabilities and the selection of asset classes in view of an optimisation of the risk-return ratio.

E.2.3. Minimum Capital Requirement

The calculation of the Minimum Capital Requirement ('MCR') takes into account a set of business related quantities comprising best estimates (from the life and non-life activity), capital at risk (from the life activity) and premiums (from the non-life activity).

The MCR amounts are calculated in two steps (of which the main intermediate results can be found in the table S.28.02.01 in the annexes).

In the first step, the linear contributions are calculated separately for the non-life and life activities. For the non-life activity, this is based on volumes of net best estimates (in total for € 1,386.3 million at 31/12/2024) and net premiums (in total for € 1,365.6 million over 2024). For the life activity, the volume of best estimates taken into account amounted to € 7,265.7 million (at 31/12/2024), while the relevant volume of net capital at risk at that date was equal to € 12,535.0 million.

In the second step, the total value is calculated with the effective application of a 'cap', equal to 45 % of the SCR at 31/12/2024; this resulted in a total MCR of € 420.5 million (vs € 425.8 million at 31/12/2023) of which € 201.1 million was allocated to the life activity and € 219.3 million to the non-life activity.

Finally, given that the own funds, eligible to cover the MCR, amount to € 1,308.5 million, the obtained MCR ratio is equal to 311.2 % (= € 1,308.5 million / € 420.5 million) at 31/12/2024 vs. 297.1 % at 31/12/2022. Baloise Belgium NV complies with the minimum required level of 100 %.

The table below summarizes these results by comparison with the situation at 31/12/2023.

Minimum Capital Requirement (MCR) by activity

	2023	2024	change vs. previous year
In '000 EUR			
MCR Life	216,942.2	201,139.7	-7.3%
MCR Nonlife	208,867.8	219,334.5	5.0%
Total MCR	425,809.9	420,474.2	-1.3%
MCR Ratio	297.1%	311.2%	

The proportional decrease of the total MCR over 2024 is identical to that of the SCR over the same period (-1.3 %). The contribution from the non-life activity to the MCR has now exceeded that from life, among others thanks to the risk mitigating effect the 2024 classic life reinsurance transaction has on the part of the life portfolio it covers.

E.3. Use of the duration-based equity risk sub-module for SCR calculation

During the reporting period, the company did not use the duration based approach to calculate the capital requirement for equity risk.

E.4. Difference between the standard formula and any internal model used

During the reporting period, Baloise Belgium NV did not use any internal models, hence this section is without object.

E.5. Non-compliance with the MCR and the SCR

The company has the necessary processes in place to monitor its compliance with its MCR and SCR on a continuous basis. Over the considered reporting period, the company continuously complied with all regulatory and internal, risk appetite based capital requirements.

E.6. Other relevant information

There is no additional relevant information to be mentioned.
